MAGALOY (nodular iron) ROLLS

FROM 7" TO 42-1/2" DIAMETER

TYPICAL APPLICATIONS

MAGALOY GRADE "A"
(Sclerescop Hardness 30-38)
Piercing Mills

MAGALOY GRADE "B"
(Sclerescop Hardness 45-55)
Blooming Mills • Bar & Billet Mills—Roughers
Rod Mills—Roughers • Plug Mills (5 1/2" and over)
Skelp Mills • Hot Sheet Bounce Mills

MAGALOY GRADE "C"
(Sclerescop Hardness 58-65)
Merchant Mills—Leaders and Finishers
Rod Mills—Intermediate Train • Hot Strip Mills
Cont. Bar & Billet Mills—Intermediate & Finishers
Plug Mills (up to 5 1/2")
Tube Mills—Forming & Welding, Sizing, Reelers
Straightening • Skelp Mills • Edging Mills

MAGALOY GRADE "D"
(Sclerescop Hardness 66-70)
For applications requiring higher-than-average
strength and hardness penetration.

• MUCH LESS BREAKAGE • BETTER SURFACE ON ROLLED MATERIAL • LOWER
PER TON ROLLED • WEARING QUALITY OF GRAIN ROLLS • PHYSICALS EQUAL TO
STEEL • UNIFORM HARDNESS PENETRATION • SUPERIOR MACHINING PROPERTIES

A SPECIALIST AND A PIONEER IN NODULAR IRON

One of the first licensees (1951) for nodular iron, Aetna-Standard's foundry has built a reputation as a specialist in these rolls (trade name — Magaloy). In the making of nodular iron rolls, control of penetration is most important. So is the order of the foundry to deliver the same uniformity of rolls order after order. As a pioneer and a specialist in nodular iron, Aetna's foundry has an excellent reputation among roll users and suppliers, particularly for penetration and uniformity of rolls.

AETNA • STANDARD

THE AETNA-STANDARD ENGINEERING COMPANY

GENERAL OFFICES: PITTSBURGH, PA. • PLANTS: ELLWOOD CITY, PA., WARREN, OHIO • RESEARCH LABORATORY: AKRON, OHIO

CHILLED AND SAND IRON ROLLS • MOLY CHILLED IRON ROLLS • ASEX GRAIN ALLOY IRON ROLLS • ALUMINUM GRAIN, NICKEL CHILL (A-B-C-D) • RAIL FINISHING ROLLS • MAGALOY ROLLS • TUBE MILL ROLLS & ROLLERS

He never takes anything for granted

It's rare that a Bethlehem inspector has to reject a piece from the drop-forge shops. Bethlehem closed-die forgings are made with great care, and are checked frequently before they reach the inspector. Nevertheless, he never takes anything for granted. His job is to *know* that the product is right before he approves and

releases it prior to shipping.

Final inspection, of course, is only one of many hurdles that a Bethlehem drop forging must clear. But it's a tough one; it's bound to be. A good inspector must forget he has a heart, and think only in terms of cold, impersonal specifications.

Bethlehem inspectors always

know their business. And they're mighty conscientious. That's one of the reasons why you can order Bethlehem drop forgings with complete confidence.

*Another cost-conscious
manufacturer finds that—*

When the going gets tough ...put it on a Warner & Swasey

A modern Warner & Swasey Turret Lathe's cost-cutting combination of power, rigidity and accuracy has increased production of this piece 200% for R. H. Little Co. of Canton, Ohio.

TOUGH STEEL diesel-electric locomotive parts, designed by The Timken Roller Bearing Company, are run in 500-piece lots at the rate of 12 to 15 daily on R. H. Little's new Warner & Swasey 4-A Saddle Type Turret Lathe.

In addition to heavy stock removal, severely-interrupted cuts put a terrific strain on both tooling and machine. But their Warner & Swasey's power and rigidity easily handle this job.

This same casting was previously machined at the rate of only 5 a day when run on a 20-year-old lathe. Production was held down due to the machine's lack of horsepower and rigidity. This caused excessive downtime for tool changing and required constant operator attention to maintain required accuracy.

This is but another example of how today's alert metalworking management is profiting through the realization that... **When the going gets tough ... put it on a Warner & Swasey.**

YOU CAN PRODUCE IT BETTER, FASTER, FOR LESS ...WITH A WARNER & SWASEY

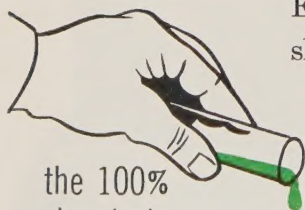

"I've never been able to assure so much protection in a chemical coolant—until now"

New HOCUT looks pure, and it is. Not only is it the best chemical cutting base from a lubricity angle—it has other outstanding merits: it cannot separate or turn rancid; it is a true *solution*—not an unstable emulsion; it has high rust preventive properties, and it helps you keep your shop clean and your machine operators happy.

And new HOCUT gives you all the advantages of a chemical coolant on all but the heaviest machining jobs. It penetrates almost instantly, cooling the work and cutting tool, preventing chip buildup and welding. A new, synthetic high molecular weight additive achieves better lubrication than most soluble oils. All this, for 6 cents a gallon, or less, in your machines.

When work comes off your machines, it's coated with a two-stage rust preventive. Why settle for less? Call your Houghton Man today—or write E. F. Houghton & Co., 303 West Lehigh Ave., Philadelphia 33, Pa. for data sheet on HOCUT 237.

behind the scenes

Construction Never Rests

You don't have to be a philosopher to realize that the surest thing in life is change, and it's a lucky thing for our economy that this is true. Poets speak of the ageless rocks, the unchanging mountains, the constant stars, but that's just a lot of fancy talk. Rocks break up, mountains wear down, and even stars hurry toward extinction. In terms of building and construction (STEEL's cover theme this week), the time of change is not measured in eons, but in centuries and decades. Construction goes up, forests come down, fields are covered by factories, earth is covered by cement.

New construction pushes down old; in some areas the forests return; fields may be reclaimed; factories expand, some move to new sites; the earth that is covered by cement and blacktop can't absorb water, so the run-off from rains causes flash floods that demand extensive new storm sewer construction.

Cities are like bodies, which renew themselves by creating new cells, shedding the old ones. Skin cells push to the surface, brushing the dead ones aside, like skunk cabbage thrusting through dead leaves in the early spring. In cities, new buildings rise through the rubble of old; new streets thread through old districts, parks grow from tenements, and ornate residential areas turn into slums. This constant flux is the lifeblood of construction, and construction is the stuff that eventually checks all recessions.

Building Rests on Change

Sometimes we are not aware of the changes going on under our eyes. Less than 100 years ago, New England (not counting Maine) was more than half cleared of forest, and farms touched one another from the sea to the mountains. Today, New England is almost three quarters forest again; agriculture flourishes, although nothing remains of many farms except open cellars in the encroaching woods. However, New England's population is greater today than it was a century ago; its construction is valued at billions more than it was just before the War between the States; its production and manufacturing facilities are far superior to what they were even before World War II.

If all the construction in Boston at least a century old were removed, how much of the city would be left? Indeed, considering the connecting highways alone, how much of the city would be left if all the construction of the last 25 years were removed? The difference in both hypothetical instances represents the volume of construction in both periods.

STEEL is interested in construction because it is going on all over the world, and because it is such a vital factor in our economy. Metalworking's stake in this market is too obvious to point out in less than 75,000 words, so we'll skip it, because we doubt if even the angels who danced on the head of a pin would be able to put 75,000 words on this page.

Construction promises to lead us to new prosperity in 1959, so be sure to read all about it, starting on Page 42.

Bang-Up Job

Say you buy your mother-in-law a stainless steel corset that's 4 in. thick and 24 ft in circumference, but the sweet old thing has taken on some footage around the equator. Her armor has to be stretched one-third or 8 ft.

How?

"It's no longer a problem," offers Associate Editor Ross Whitehead.

"My mother-in-law's weight?"

"The stretching job . . . such work used to be done with dogs, wedges, and drop hammers, a long, tiresome ordeal, but now," says Ross, "it's being done just about as fast as you can say, BANG!"

"You mean . . ."

"Yes, it's another job for explosive forming. National Northern Corp. of West Hanover, Mass., recently handled a stretching job on a part with those dimensions by sealing off one end, filling it with water, inserting a large charge of explosives, sealing off the other end, and bang! Its circumference was increased exactly one-third."

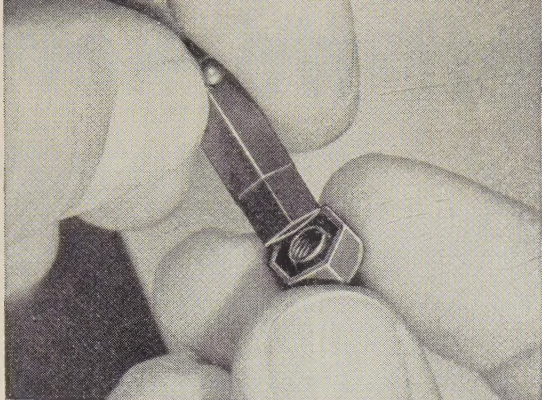

We let Ross talk that way because we know he knows whereof he speaks. His recent article on the subject ("Explosives Form Space Age Shapes," p. 82, Aug. 25) also went over with a bang. National Northern, one of the companies mentioned in it, tells us that Whitehead's piece has stimulated more than 500 inquiries to date.

Who's Sorry Now?

The U. S. Supreme Court vacated, as improvidently granted, a writ of certiorari which it had previously issued to review an order of the Court of Appeals of the District of Columbia denying a motion to vacate a stay, pending appeal to that court, of an order of the District Court of the District of Columbia enjoining the comptroller general of the United States from refusing to audit a claim of the Whosis Steel Corp. against the U. S. Got it all straight? Now, then: Was the Whosis Steel Corp. pleased, or not?

Shredlu

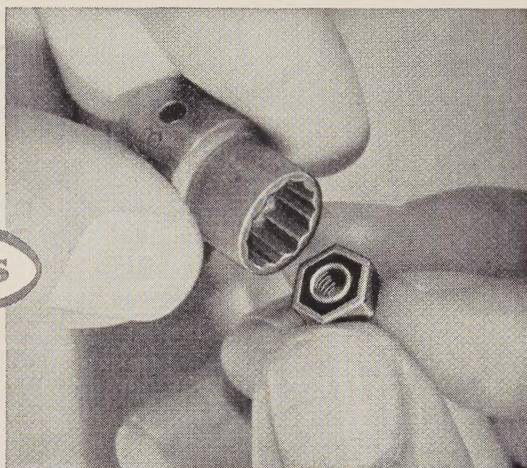

(Metalworking Outlook—Page 33)

INTERNAL

Accent on Excellence

Youngstown cold finished bars

EXTERNAL

These Boots Hex Nuts—the only nuts available today that offer 100% wrenching contact both internally and externally—are fast gaining acceptance for assembly line applications in every industry from aircraft . . . to plastic specialties.

In producing their full line of versatile fasteners, Boots Aircraft Nut Corporation of Norwalk, Conn., starts with Youngstown Cold Finished Bars as the basic raw material. They especially like the steel's superior machineability and cold working properties which are a direct result of rigid quality control over every step in their manufacture—from ore mining to final cold drawing.

Wherever steel becomes a part of things you make, the high standards of Youngstown *quality*, the personal touch in Youngstown *service* will help you create products with an "accent on excellence".

watch these giant workers chip away costs!

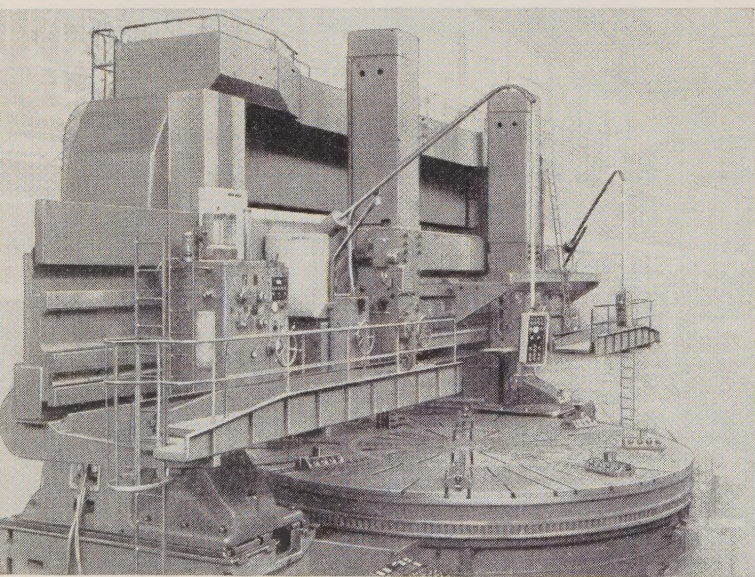

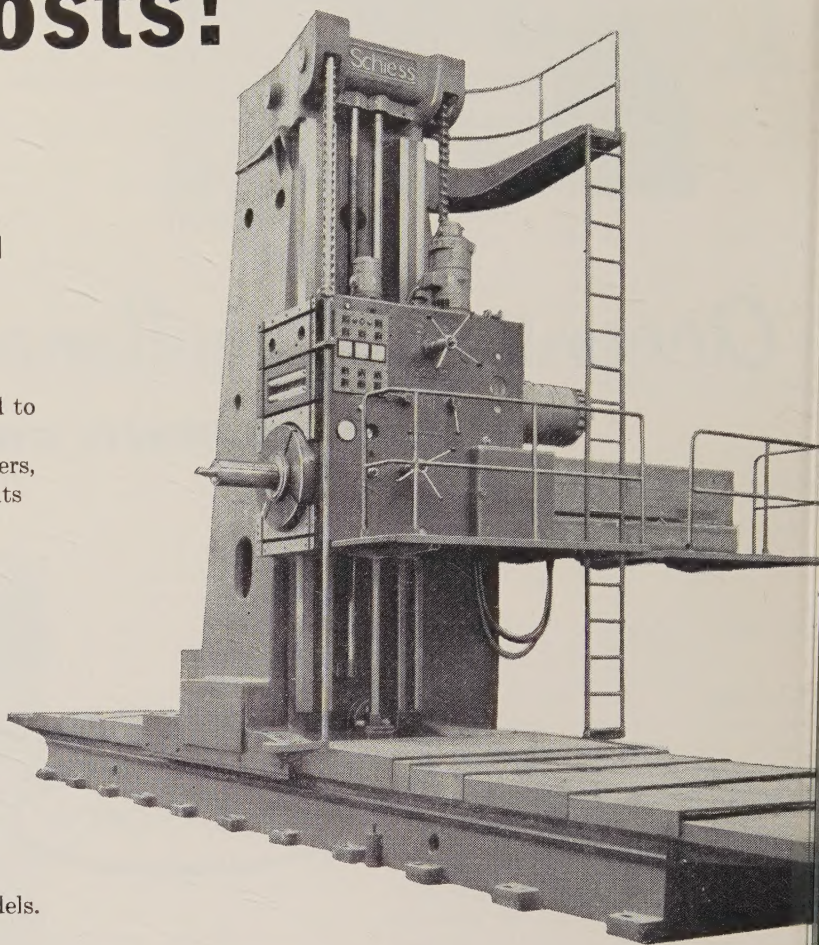

This 8 $\frac{7}{8}$ in. SCHIESS model BF horizontal boring and milling machine . . .

now completely redesigned with many innovations. Here are a few . . .

Two individual drives—gear-drive for roughing, belt-drive for finishing. Belt-drive particularly suited to high-speed machining with carbide tools. New tool clamping device—does away with draw keys, hammers, drifts and binding screws. All spindle-slide movements controlled from easily accessible operating platform (or from pendant station or portable control panel, if desired). Special main-drive belt requires no readjusting. Column, spindle-slide and boring spindle may be adjusted at rapid traverse.

Spindle diameters, 6-5/16" to 8-7/8". Maximum diameter bored, 59"—faced, 79".

It takes Europe's largest builder of heavy machine tools, Schiess, to turn out giants like these. Parts and service as close as Pittsburgh. And an American Schiess engineer will be happy to help you size up these heavy producers for your heavy production needs. Write for catalogs and complete specifications on all Schiess BF and K models.

This 32 ft. SCHIESS model GK vertical boring and turning mill . . .

Look at all these new features of the most modern vertical boring mill of its type: Two ram heads on the rail, one of which is tracer-controlled. One milling head on the rail which can be parked on the left side rail extension. Dual tables—one 15' table on the inside, a 32' table on the outside. Each table has independent drive, or both tables can be used together and synchronized as one. Table equipped with indexing device to be used for indexing layout work. Machine will swing a maximum diameter of 40'. Rapid traverse motions with pushbutton control of changeover from feed motion to independent power traverse. Electro-mechanical locking of cross-rail to columns. Fingertip speed control—counter-balanced cross-rail and side-head—completely enclosed swiveling octagon rams—pendant control—automatic lubrication.

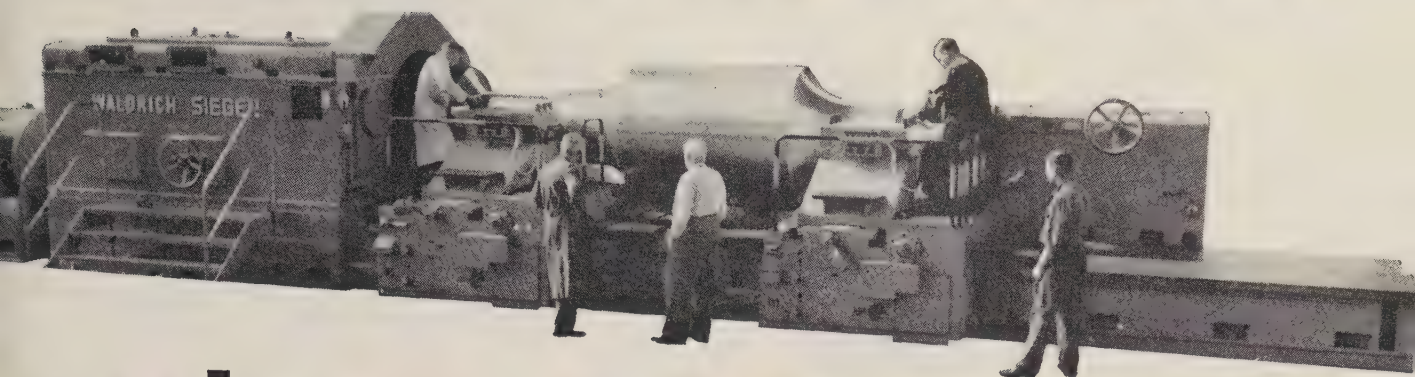

Have you ever seen anything like it?

AMERICAN SCHIESS CORPORATION

1232 Penn Avenue, Pittsburgh 22, Pa.

this Waldrich giant

swings a 90-ton roll

—cuts rough turning time 75%

You're looking at the business end of a Waldrich-Siegen Roll Turning Lathe, built to turn a workpiece as long as 30 ft., as fat as 63 in. in diameter, and as heavy as 90 tons!

Right now, you're seeing it in action at the Ohio Steel Foundry Co., Lima, Ohio, biting into a 57-ton, 98-in. long roll, with a 53-in. O.D. In just three passes, its hungry cutters will shear 15 inches of steel off this diameter. Before it's through, 12 tons of turnings will come off.

This job used to take 68 hours at Ohio Steel Foundry. The husky Waldrich breezes through it in just 16½ hours flat.

It takes plenty of muscle to peel through so much

steel and the Waldrich has it, delivering 250 horsepower to the spindle. Speed is set at the selector wheel, feed at each of the two independent carriages.

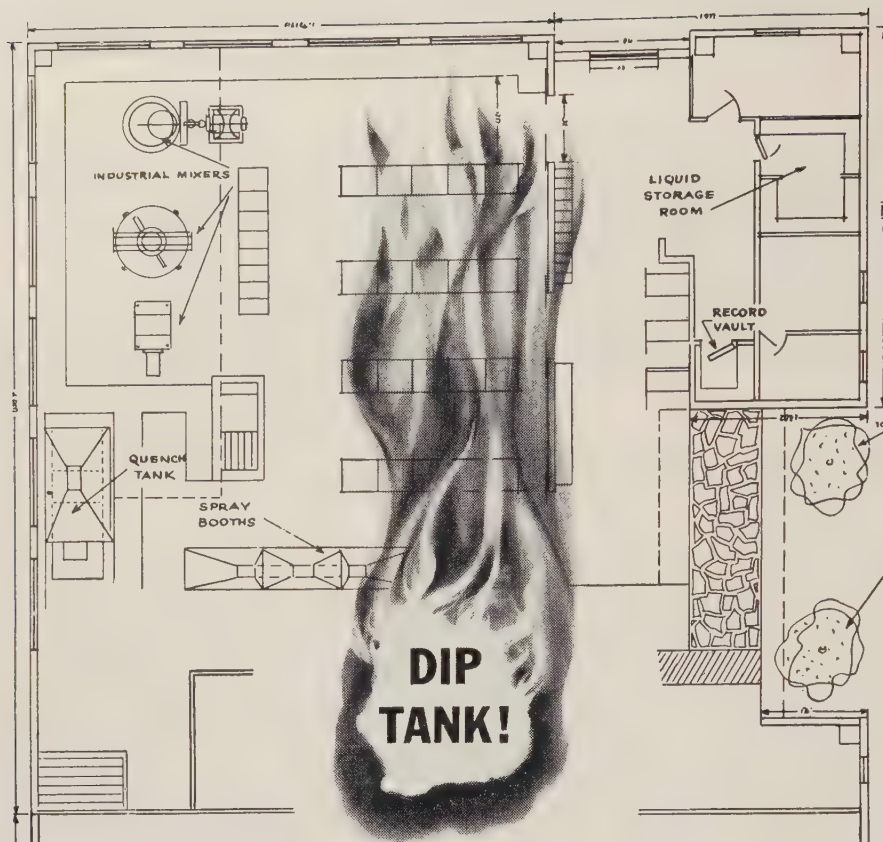

And here's an interesting economy note: chips from the Waldrich lathe are large enough to be remelted, unlike finer chips from other lathes that oxidize too quickly. Ohio Steel Foundry collects a bonus of \$15 on every ton salvaged.

Three different size Waldrich lathes are now in operation at this plant, turning workpieces with maximum O.D.'s of 36", 48" and 63". Maybe one of these sizes is the answer to your roll turning needs. It's easy to find out. Write today for complete details on these heavy producers.

american waldrich mfg. corp.

1232 PENN AVENUE, PITTSBURGH 22, PENNSYLVANIA

HOT SPOT in your plant?

Guard dip tanks, spray booths, record vaults against the danger of fire! Guard them 24 hours a day with a Kidde fully-automatic carbon dioxide fire extinguishing system. Finest fire protection on the market today, Kidde systems give you these outstanding features that come from more than thirty years' experience!

All operating parts completely enclosed to guard against fouling or accidental operation.

No clumsy triggering methods or falling weights.

Self-contained; no outside power needed.

Visual indicators to show if system has been operated.

Easy testing of all operating parts.

No parts to replace after operation or test.

Fast-acting, clean carbon dioxide does the job that no other extinguishing agent can do: snuffs fire out in seconds, then vanishes into thin air. Won't harm valuable machinery, leaves no mess to clean up. For detailed information see Sweet's Plant Engineering Catalogue or write Kidde today.

LETTERS TO THE EDITORS

Industrial Fair Great Success

I want to compliment you on the fine article, "Industrial Shows Go to County Fair" (Sept. 22, Page 41). It drew a lot of interest and comments from the manufacturers. The purpose of the industrial fair was well expressed.

The fair was a tremendous success and the manufacturers were impressed with the public interest. The public relations gained was worth all the effort.

Royal L. Breed

Sterling Commercial Steel Ball Corp.
Sterling, Ill.

Sales and Purchasing Profit

We would like to use your article, "Purchasing for Profit" (Oct. 13, Page 89), for review to see if our purchasing department is checking everything possible, and to see if our sales department is studying our selling from a purchaser's standpoint.

Edw. D. Hendrickson

Executive Vice President
Hendrickson Mfg. Co.
Lyons, Ill.

This is a fine article, easily understood and sincere, on a subject of vital importance to management. It is proof positive that "material management" is secure and need not live off a company's sympathy fund.

G. Lebert

Director of Purchases & Materials
Standard Register Co.
Dayton, Ohio

John Q. Public Bargains, Too

Congratulations on your editorial, "Mr. Reuther Has a Point" (Sept. 29, Page 53). Through my 50 years of industrial experience, I have always maintained that intelligent labor leaders and similarly qualified management men should sit down at least once a month around a dinner table, whether the organization be a plant or an industry. It's an unfortunate fact that outside of the few professionals who are trained to deal with

(Please turn to Page 12)

"YOUR
PLANT,
SIR..."

FROM FOUNDATION TO DEDICATION
BLISS WILL BUILD
YOUR "TURN-KEY" PLANT

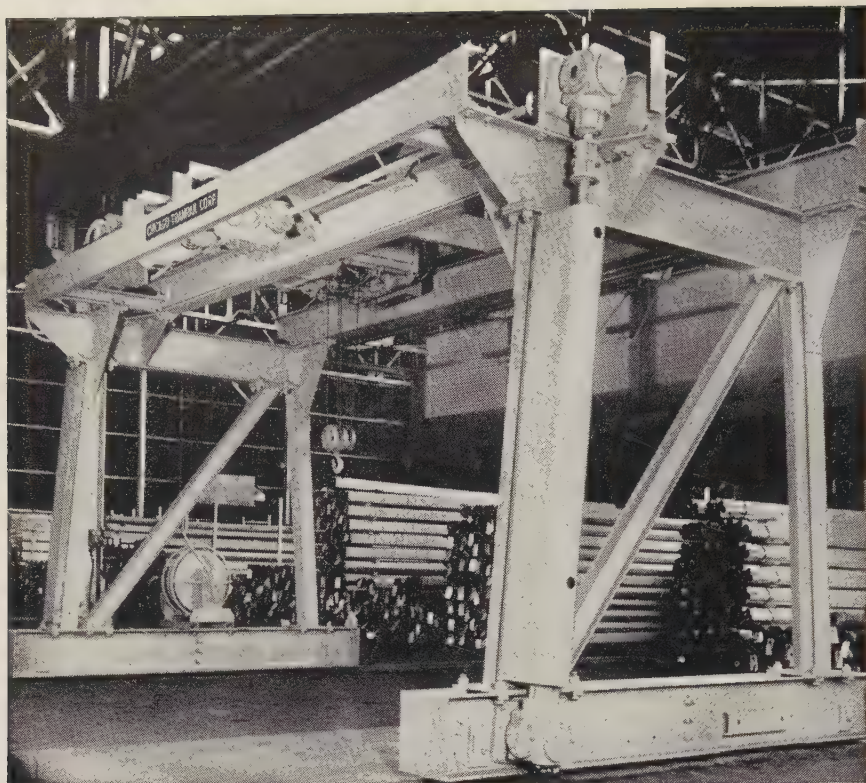

... Bliss will shoulder the entire job of building and equipping your next metalworking plant. And whether you need a complete plant... a single piece of equipment... or fast fabrication of heavy components, it's wise to get a bid from BLISS.

BLISS
SINCE 1857

Bliss is more than a name—it's a guarantee

LETTERS

(Concluded from Page 10)

labor negotiations, both sides frequently pick the wrong kind of representatives to do the bargaining, a loud mouth and a bellicose attitude apparently being the qualifications which secure nomination to the job.

I am not against unions; in fact, I have always preferred to deal with a well-organized, disciplined union rather than a heterogeneous mob of people for whom no one can speak with authority. However, there is a third, but most often silent, partner sitting in on most labor negotiations and that is Mr. John Q. Public, and I'm he in these talks between Walter Reuther and the automobile industry.

Frankly, I'm fed up with the high prices of new cars. As for buying a new car, I'm just plain on strike. In the last analysis, I, John Q. Public, am the boss because if I refuse to buy a new car for any serious period of time, that will bring a lot of changes in attitude of those people who are sitting around the table figuring out by how much they can deplete my yearly earnings to keep their plush-lined automobile industry viable.

Incidentally, the steelworkers live mostly off the automobile industry (don't they?), so Mr. McDonald might possibly be interested in the fact that John Q. Public is on strike against the gouging that he has been getting these last few years, and while he does not particularly like these little "sputniks" that come from Europe, he is going to buy more and more of them. Why? Because he is fed up with being gouged by his own people. The "sputniks" are proving that we can still hold the road without big tail fins, super-duper chrome, Christmas-tree lights and a general air of rhinestone elegance.

3 WEEK DELIVERY

TRUSCON "Budget-Buildings"

Truscon Steel "Budget Buildings" are the fast, economical way to provide warehousing, enlarge manufacturing facilities, erect field offices at lowest cost. Available with 3-week delivery from order to job site!

Basic framework is of rigid frame design, shop fabricated from hot rolled structural sections, complete with all necessary connection plates and anchor bolts. Purlins and girts are cold formed channel sections, bolted with standard machine bolts.

Roofing and siding are 26-gage galvanized roll formed ribbed sheets 24" wide, and in continuous lengths.

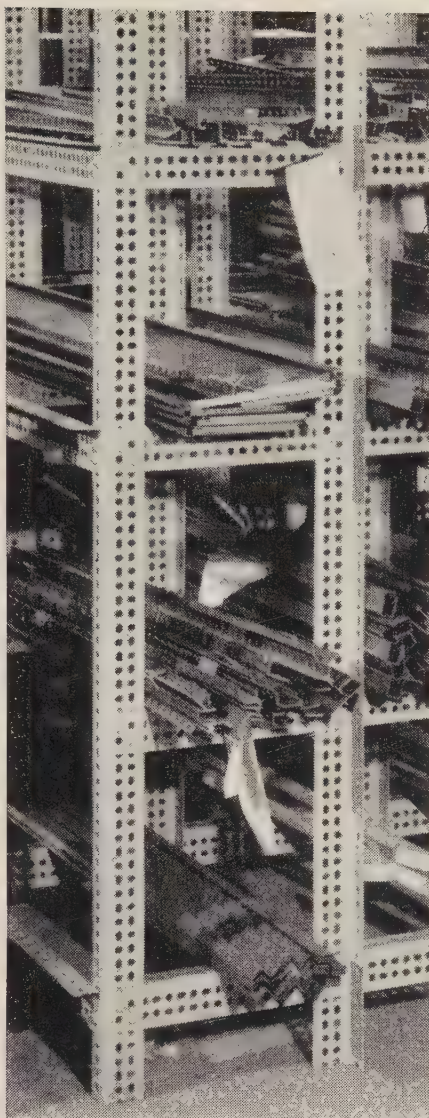

Sheets are rolled from Republic tight-coated, continuous hot dip galvanized steel . . . will not flake, crack, or peel. More rust resistant than ever and no painting needed.

Truscon "Budget Buildings" are available in widths of 32, 36, 40, 44, and 48 feet—12- and 14-foot heights, in any lengths necessary. All roofing, siding, windows, doors, and hardware are shipped to the job site as a package.

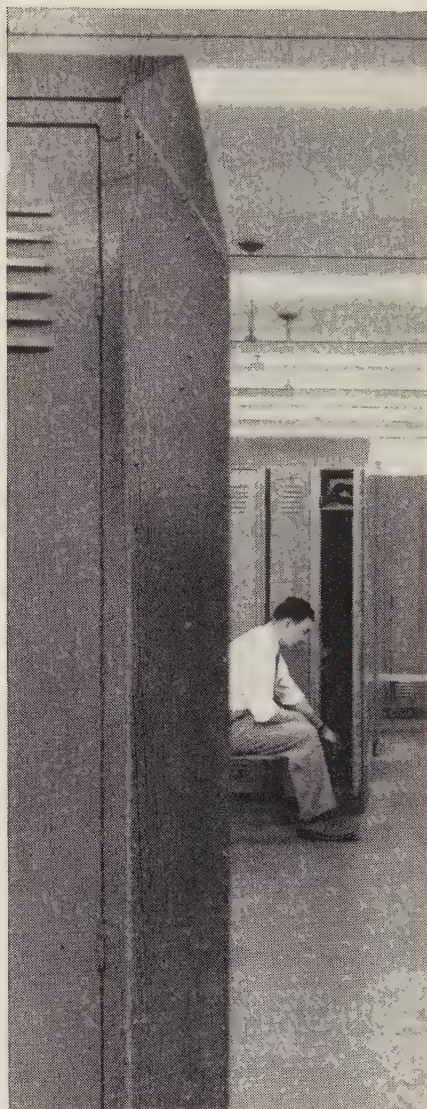

To learn more, call your Truscon representative, or write for attractive, full-color brochure.

REPUBLIC COIL COVERS provide excellent weather protection, shut out dirt, stop vandalism, eliminate costly replacement of short-lived tarpaulins, eliminate the need for paper wrappings on coils. These coil and car covers are 22 feet long, 6 feet wide, and 6 feet high. Two covers are used with each 52-foot gondola car, easily handled by overhead or trackage crane. Designed for stacking. Send coupon for more shipping protection facts.

REPUBLIC METAL LUMBER® saves time, space, and money! Precision engineered system of short slots placed to allow $\frac{3}{4}$ " vertical and horizontal adjustment, offers unlimited applications. Simply measure, cut, assemble. Bonderized to resist rust and damage; baked enamel finish. Delivered in bundles of 10 angles, .080 gage or .104 gage, 10- or 12-foot lengths, bolts and nuts included. Stores in space of one 2" x 4" piece of lumber. Send coupon for idea-packed catalog.

REPUBLIC STEEL LOCKERS offer clean, attractive, dress-wash-change facilities. Interiors are spacious, well designed for convenience and ventilation. All furnaces are Bonderized to resist rust, retard corrosion, and provide better paint adhesion. Finish is baked enamel. Positive locking, heavy-duty steel construction assure protection of personal effects and tools. Call your nearest Republic representative, or send coupon for data, prices, and delivery.

**Automatically positions work pieces
for your Drilling . . . Tapping . . . Reaming
Milling . . . Pressing . . . Welding operations
Saves the costly time of hand feeding**

**Electrically controlled, rotary
or linear work feeders are easily
installed, readily synchronized
with any machine cycle**

QUALITY CONTROL CAN BEGIN AT THE POINT-OF-OPERATION WHEN YOU FEED PARTS WITH BELLOWS WORK FEEDERS

You will have many more acceptable parts at Final Inspection if you examine work pieces at the point-of-operation. To give machine operators time for visual inspection, feed parts to tools with Bellows Work Feeders. The operator will then have time to load at one station, unload and examine a finished part while his machine continues to work. Not only will there be time for examination of the machined part but you will be able to use more of the machine's

producing ability. The tool won't be standing idle while the operator loads and unloads.

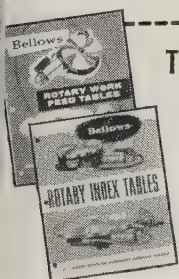

Bellows Work Feeders are made in both rotary and linear type models; different units designed for high speed parts positioning where tolerances are not critical, or precision indexing types where close accuracy is required.

Air-Powered, electrically controlled, they are easily installed on standard machine tools, can be readily synchronized to work with the basic machine cycle.

To cut machining costs . . . keep the machine working while you load or unload a fixture.

These Bulletins give you the Facts

Write for Bulletins RT 1022 and RT 1326 for full specifications and application data on Bellows Work Feeders. Address Dept. ST-1158, The Bellows Co., Akron 9, Ohio. In Canada, Bellows Pneumatic Devices of Canada, Ltd., Toronto 18, Ontario.

DIVISION INTERNATIONAL BASIC ECONOMY CORPORATION

AKRON 9, OHIO

integrated CRUCIBLE steel service

Crucible inside account salesmen (1) simplify ordering and expedite deliveries of the steels you need,

(2) arrange for handling extra services, (3) supply you with basic steel and metalworking data.

staffs 27 local warehouses with specialized personnel to solve your specialty steel problems

"We frequently rely on Crucible warehouse people," says one of our good customers. "We've found they can sometimes show us more economical steels, sizes and methods than those we're using. Furthermore, they give us valuable help with steels we're using for the first time."

This steel buyer, like thousands of others, believes in getting services with the steels he buys. Here's what he gets:

Crucible inside account salesmen help him simplify ordering, speed up his deliveries. They can efficiently arrange for extra services, such as forging, slitting, grinding and polishing, because of their special training at Crucible mills.

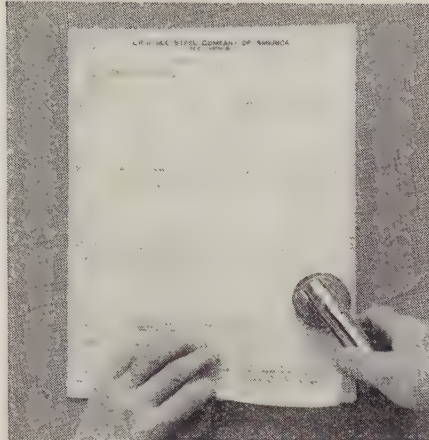

Crucible sales-service engineers give their production and toolroom people valuable metalworking assistance. They'll recommend machining speeds and feeds, quenching temperatures, the best forming and joining methods.

Behind these specialists are the resources of Crucible's entire, integrated operation—from mining the ore to steelmaking to warehouse delivery to you. Why not take advantage of these services each time you order specialty steels? They're available through every Crucible warehouse. *Crucible Steel Company of America, Dept. PK15, The Oliver Building, Mellon Square, Pittsburgh 22, Pa.*

STOCK LIST

Keeps you up-to-date on local stocks of specialty steels. Just ask the Crucible salesman to place your name on the regular mailing list.

One Source
For All
These Steels

Need certified test reports for government work? Warehouses can supply the steels and notarized reports of analyses.

Trained, experienced sales-service engineers can help your engineers use steels that are new to you.

This is the easiest way to arrange for forging, flame-cutting—have the warehouse accommodations service do it for you.

TOOL STEELS—Water, oil, air hardening, shock resisting, hot work, plastic and die casting steels in all forms, including bars, sheets, plates, drill rod, hollow bars, forgings and flat ground stocks

HIGH SPEED STEELS—Crucible's famous "Rex"® steels: Rex Thrift Finish rounds, hot rolled and cold drawn flats and squares, drill rod, forgings, sheets, plates, and tool bits

STAINLESS STEELS—Bars, sheet, strip, wire, cold heading wire, metalizing wire, plates, angles

FREE MACHINING STEELS—Crucible Max-el® rounds, hexagons, plates and brake die steel

ALLOY STEELS—Bars, billets, strip and sheet

COLD ROLLED CARBON SPRING STEELS

DRILL STEELS—Hollow and solid drill steels

ALUMINUM EXTRUSION DIE STEELS

HOLLOW TOOL STEEL

WELDING AND HARD FACING ROD

FOR NATIONAL STEEL

KOPPERS BUILDS WORLD'S

Weirton Steel's sintering machine is one of the world's two operating 12-foot wide machines for sintering iron ore. This machine was designed to produce a minimum of 5,500 tons of sinter product per day.

LARGEST

SINTERING MACHINES

The two largest iron ore sintering machines in the world—both 12 feet wide—are now in operation. Both are part of plants built by Koppers. Both are helping Divisions of National Steel Corporation improve productivity.

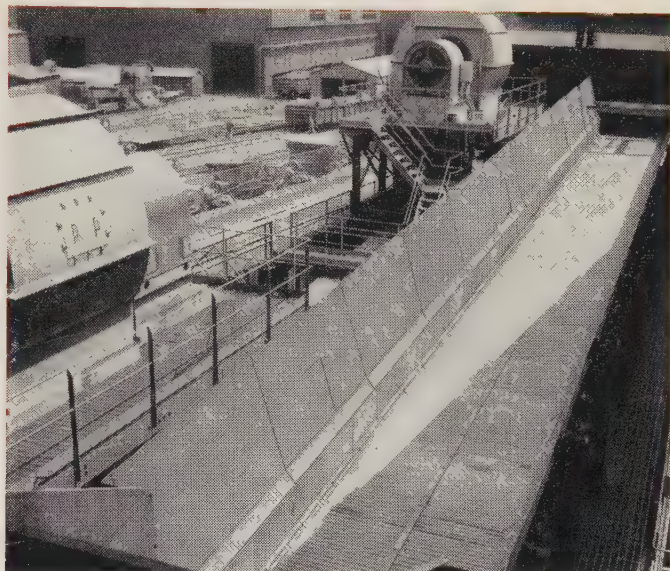

The machine shown here is operating at Weirton Steel Company. It is 12 feet wide, 147 feet long over the wind boxes, has a total grate area of 1,764 sq. ft. It was designed to produce 5,500 tons of sinter product per day.

An even larger machine is also in production at Great Lakes Steel, another Division of National Steel Corporation. This new giant is 12 feet wide and 199 feet 6 inches long over the wind boxes. It was designed to produce 7,200 tons of sinter product per day.

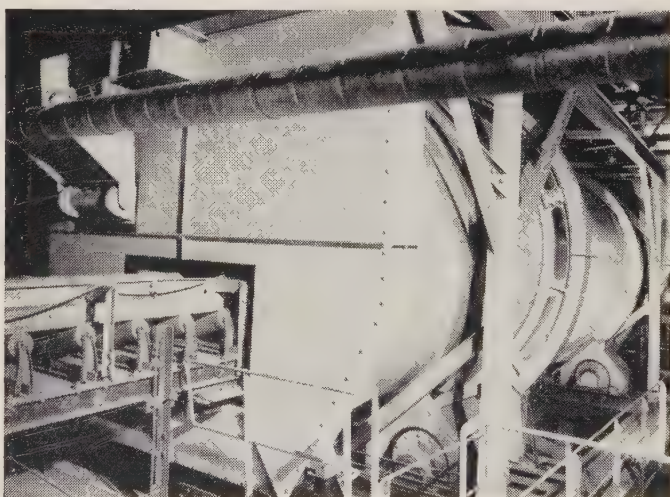

These two pioneering machines are typical of the continual modernization program being carried on throughout the National Steel organization. A forward-looking approach on the part of National Steel's operating and management personnel, and their complete co-operation and assistance during every phase of engineering and construction, contributed greatly to the successful completion of these two projects by Koppers.

Comprehensive Koppers service to the steel industry includes design, engineering, procurement, construction and initial operation of almost any type of equipment.

If you need help or advice on any expansion or modernization project, call on Koppers—the world's largest, most experienced, best qualified steel-plant construction firm. Our engineers and management personnel can be reached at Koppers Company, Inc., Engineering and Construction Division, Pittsburgh 19, Pennsylvania.

The straight-line, forced-draft sinter cooler of Weirton Steel's new sintering plant is 10 feet wide, 147 feet long.

This 12' x 40' balling drum, in use at the Weirton plant, is designed to prepare the raw mix material fed to the sinter machine.

KOPPERS

It's smaller . . . easy to mount . . .

This is *not* simply a rerated motor. The Century Electric short motor is a standard motor available in ratings up to 15 hp, but . . . it has been redesigned to cut down length as much as four inches. It is designed to save space and weight for application on machine tools, roof ventilators, pumps, centri-

fuges and many other types of equipment.

Easy to mount: You can use this motor in place of any end-mounted motor because it has a standard flange. It can also be mounted horizontally, vertically or at any angle. Its small size means it can be mounted almost anywhere on equipment.

lighter . . . *The Century Electric short motor*

Variety of applications: The short motor gives dependable performance on applications requiring frequent start-stop operation. You can get it in totally enclosed or open frames. And it has the same quality features and high standards of all of Century Electric's complete line—up to 400 hp.

More than a motor: This motor is the result of a continuing search for ways to meet industry's needs. Another reason why you get *more* than a motor from Century Electric.

For more details contact your nearest Century Electric Sales Office or Authorized Distributor.

WIRE IN FIBRE DRUMS

reduces downtime...cuts scrap loss

CF&I Wire is now packed in fibre drums to keep it rust- and dust-free from the last pass on the drawing frame, through shipping and storage, until the sealed fibre drum is opened at your wireforming machines.

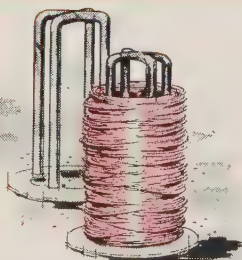

Less Handling—Longer Runs

CF&I Wire in fibre drums ends the cost and inconvenience of having to handle small coils manually. You get from 400 to 600 lbs. of wire in *one continuous length*. That means less downtime, less scrap loss. Note the following comparison.

500 lb. Fibre Drum	70 lb. Coil	Comparative Results
Wire Diameter .0468" 170' per lb.	Wire Diameter .0468" 170' per lb.	Fibre drum provides 7 times as much continuous production. Reduces necessity for stopping equipment for coil changes.
Total Footage—85,000'	Total Footage—11,900'	

If your manufacturing process is not equipped to use fibre drums, order our economical 500-800 lb. capacity reels or non-returnable "spiders." Half fibre drums (holding from 250 to 400 lbs. of wire) and steel strapped or paper wrapped coils are also available. For high or low carbon steel wire; round, flat or shaped; in any size, temper, grade or finish, make CF&I your source of supply.

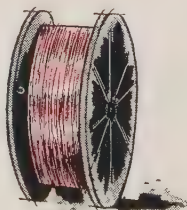

OTHER CF&I STANDARD PACKAGING METHODS

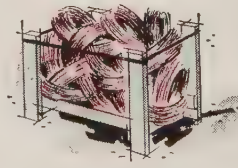

Returnable spiders
(2000-4000 lbs. capacity)

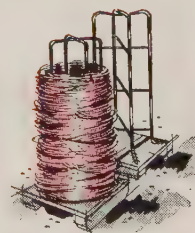

Steel strapped coils
(200-2000 lbs.)

Reels (500-800
lbs. capacity)

Steel strapped
wooden rack

Non-returnable spiders
(500-700 lbs. capacity)

VERSATILITY

Saves **TIME & MONEY** *in Maintenance Shops*

Photographs show a Landis Pipe Threading Machine installation in a Job Shop of the New York Central Railroad. This shop, located at Weehawken, New Jersey, operates as a Marine Repair Shop handling maintenance for tugs, barges, lighters, etc. Illustrations show wrought iron pipe being cut off after reaming and threading. Standard pipe threads are cut $1\frac{1}{2}$ " long on the 4" pipe, using a cutting speed of 25 surface feet per minute. This machine is also used for cutting boiler tubes to length.

The wide diametrical range of the die heads and the use of patented tangential pipe chasers gives these machines a versatility invaluable in maintenance work. For example, the 6" Landis Pipe Threading Machine illustrated threads all pipe sizes from 1" to 6", inclusive. Size adjustment of the die head is simple and quick. Chasers need not be changed except for threads of a different pitch, form, or taper. Chasers are interchangeable and need only be replaced singly as needed. Tangential cutting action reduces wear, and chasers can be reground to use over 80% of their length. Write for Bulletin C-61.

LANDIS Machine COMPANY

WAYNESBORO · PENNSYLVANIA · U. S. A.

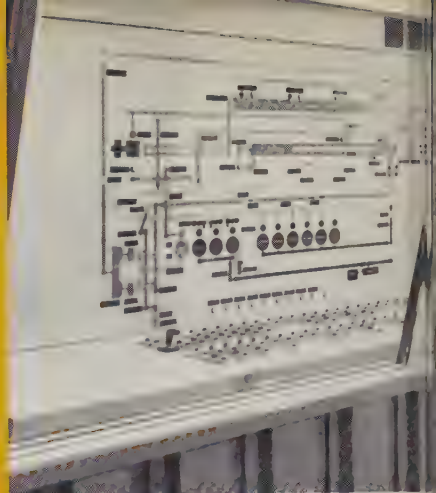

Historical dates in Continuous Sintering

1906 The continuous sintering process was invented by Arthur S. Dwight and Richard L. Lloyd following extensive experiments at the Greene Consolidated Smelter in Cananea, Mexico. Patent was applied for.

1908 The first patents on the process were granted.

1908 Dwight and Lloyd applied for a patent on the product — a cake of sinter — which was granted.

1908 The first commercially successful continuous sintering plant was installed at Salida, Colorado at a multi-metals smelter. It marked the establishment of the "straight line" or classic machine, the design that endures to this day.

Richard Lloyd shown charging the Dwight-Lloyd invention machine on the day the continuous sintering process was born. An original photo, preserved in the Dwight-Lloyd historical archives.

1908 Dwight began his first investigations of a sintered beneficiated blast furnace charge for ferrous industries.

1909 Dwight and Lloyd granted a license to Lurgi-Gesellschaft to build sintering equipment under the Dwight-Lloyd patents.

1911 The first ferrous sintering plant was installed at Birdsboro, Pennsylvania. The plant was designed by Dwight and Lloyd and delivered by a licensee, American Ore Reclamation Company.

1920 The Dwight-Lloyd Research Laboratories were established to fully investigate minerals processes.

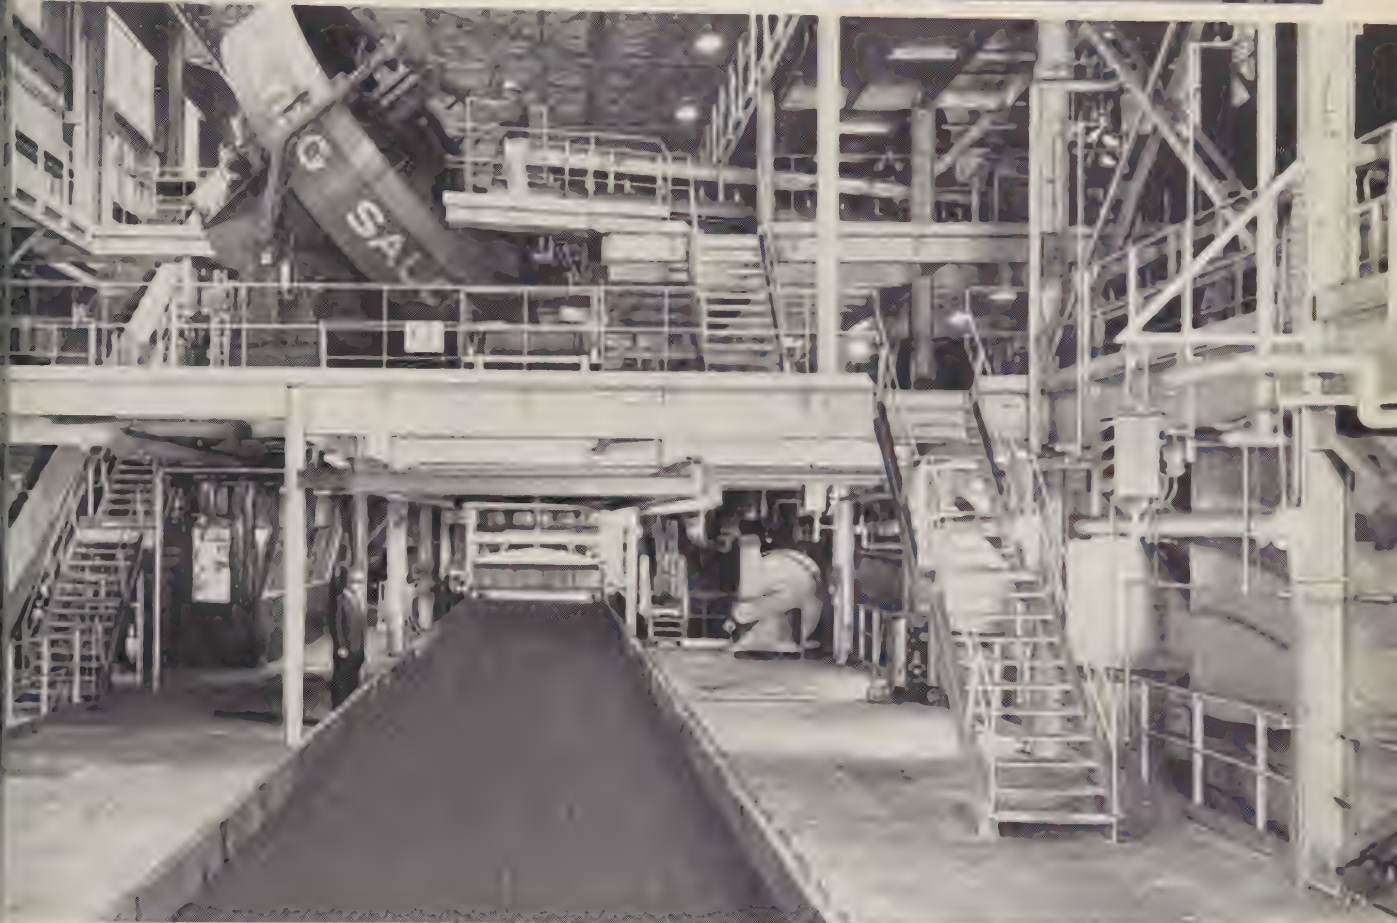

1955 McDowell Company, Inc. acquired the business and assets of Dwight and Lloyd, including the Laboratories, and moved them to Cleveland, greatly expanded.

Now

Left, automated control center for new 5,000 ton per day single strand ferrous Dwight-Lloyd® sintering plant. Above, general view of plant. Right, the McDowell-developed Flying Saucer®, unsurpassed as a sinter mixing and pelletizing disc.

Flying Saucers charging proportioned feed to Dwight-Lloyd machine at Ohio Works, U.S. Steel Corp.

DWIGHT-LLOYD SHOWS SINTERING'S GOLDEN ERA

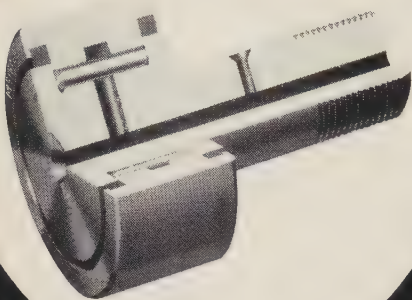

Big production ferrous installations are the newest Dwight-Lloyd sintering plants, developed to increase capacities of high-investment blast furnaces through beneficiation of raw materials. This acknowledges the work of our illustrious ancestors, the American metallurgists Dwight and Lloyd, who invented and pioneered continuous sintering, and proved to Illinois Steel Co. in 1908 the economical merit of sinter as blast furnace feed.

Culminating fifty years' practice, today's rugged Dwight-Lloyd plants reflect advanced McDowell engineering and U.S. tonnage experience in 1) proportioning and blending, 2) ignition, 3) burning and 4) cooling — all pilot-plant-proved in our famous Dwight-Lloyd Research Laboratories, established by the inventors in 1920, busy ever since on behalf of an international clientele engaged in all phases of minerals processing. Exclusive: Wellman hell-for-stout fabrication.

BEARING TIPS

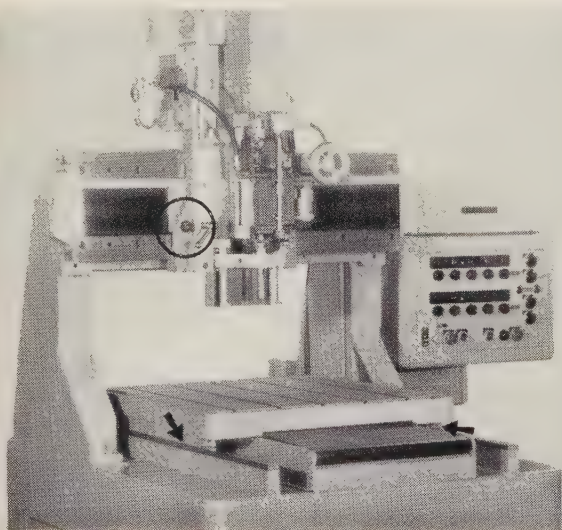

by McGill

McGILL sealed **CAMROL**[®] bearings protect roller follower efficiency — prelubricated to reduce maintenance

Sealed SCF series bearings add protection from contamination to the extra performance advantages of McGill CAMROL cam followers. Specially treated labyrinth seals at the roller ends keep out moisture, dirt, chips, etc. All exposed surfaces are treated to provide a corrosion resistant black ferrous oxide finish.

The sealed construction with a channeled grease reservoir in the outer race bore eliminates need for frequent relubrication. Maintenance is reduced and can be eliminated in inaccessible mountings. Specify standard bearings and avoid building up followers with extra seals.

Sealed CAMROL bearings as table and crosshead rollers in tape-controlled Hillyer drilling machine

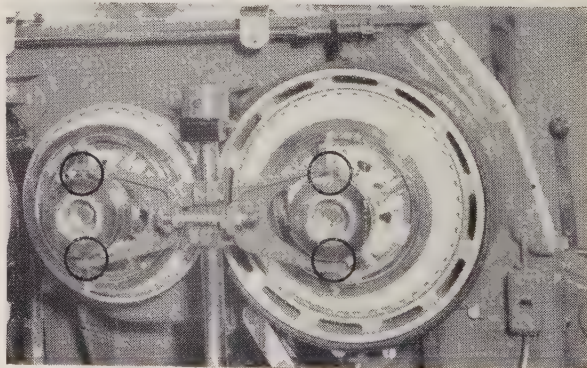

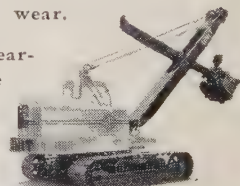

CAMROL bearings provide smooth, accurate motion as load carrying rollers for table and crosshead motion of this tape-controlled, precision drilling machine manufactured by HILLYER CORPORATION. Use of these bearings has simplified construction and improved accuracy. They have eliminated the manufacture of shaft and retainer assemblies and increased load capacities. The corrosion resistant finish has also eliminated the need for plating bearings. Ball bearings formerly used cracked under the same loads. Operating speeds are 400 RPM and loads are 2000 pounds. The bearings are prelubricated and sealed to keep maintenance at a minimum.

Sealed CAMROL bearings replace bronze rings in shovel clutches

UNIT CRANE & SHOVEL CORPORATION is using SCF SEALED CAMROL bearings in clutch shifter yokes in their 1/2 and 3/4 yard power cranes and shovels and Model 360 MARINER 30-ton cranes. Shown is a closeup of two of the five clutches which control the hoist drum and the hold drum and various actions of the machines. The bronze collars formerly used were higher in initial cost than the CAMROL bearings. Their use also required considerable machining and the addition of component parts such as bolts, spacers, etc.

The CAMROL bearings in this application promise better, more accurate control than the bronze shifter rings which tend to become "sloppy" with wear.

The integral seal feature of the bearings protects their performance under field conditions and reduces relubrication requirements.

Lectromelt's smooth-operating hydraulic mechanism assures rapid, accurate forward tilting for pouring, backward tilting for slag-off.

LECTROMELT FURNACES

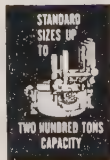

replace open hearths...

increase ingot capacity 70%

...lower production costs

Lectromelt®

CANADA: Canefco Limited, Toronto... ARGENTINA: Master Argentina, Buenos Aires
... ITALY: Forni Stein, Genova... ENGLAND: Electric Furnace Co., Ltd., Weybridge
... GERMANY: Demag-Elektrometallurgie, GmbH, Duisburg... SPAIN: General
Electrica Espanola, Bilbao... FRANCE: Stein et Roubaix, Paris... BELGIUM: S. A.
Stein & Roubaix, Bressoux-Liege... JAPAN: Daido Steel Company, Ltd., Nagoya

Two new 100-ton Lectromelt furnaces... largest electric-arc furnaces in the eleven western states... recently replaced gas-fired and oil-fired open hearths in a leading West Coast steel mill.

Now, a heat takes 4½ hours or less from the time the first scrap steel is placed in the furnace until the molten steel is ready to pour. Each Lectromelt furnace produces an average of 25 tons of ingots per hour. Capacity of the plant has been boosted from 246,000 to an estimated 420,000 ingot tons per year.

Top-charging Lectromelt furnaces are increasing metal-producing capacity all over the world. Users report higher tonnage per man-hour, lower power consumption, savings in electrodes and refractories. Precise control possible with Lectromelt furnaces contributes to greater uniformity and more accurate alloying of metals.

For complete technical data—ask for a copy of Catalog 10. Write Lectromelt Furnace Division, McGraw-Edison Company, 323 32nd Street, Pittsburgh 30, Pa.

Financing Inventories To Become Tougher

Public Buyers

Washington—The cost of borrowing money is going up. Eventually it will get tougher to obtain financing for inventory growth although bankers appear to have plenty of money for that type of borrowing now.

This is the credit outlook from a purchasing point of view over the next six months as seen by government officials specializing in finance. It stems from a drive by the Federal Reserve and Administration to halt inflation by tightening credit.

Reports from bankers around the country indicate general agreeability toward short term loans, but a growing reluctance for long term, capital goods type of borrowing already's developing but not in all areas. So far inventory group has not been

... Steel users may find tighter inventory controls the best hedge

"Let the other fellow carry the inventory" is a well-tryed business principle that is taking on added significance for many manufacturers today.

As featured in a recent issue of PURCHASING WEEK, the cost of borrowing money is going up. Over the next six months, inventory growth financing will get tougher. Even now, the publication pointed out, there's a growing reluctance by bankers to make long-term, capital-goods type loans. The newspaper concluded that interest rates, too, are heading rapidly toward the high levels reached during 1957's tight-money period.

Faced with these new complications, steel buyers may well find continuance of recession-born, modified inventory policies the best hedge against tight money and higher interest.

For example, during the recent slump many companies proved to themselves that the varied facilities of steel service centers cut costs all

along the line. They avoided long-term commitments and substantially reduced their need to borrow money. They released precious working capital for more productive purposes... freed valuable storage space... reduced handling costs and cut scrap loss, interest, insurance, taxes, etc.

This kind of cost-conscious buying is especially sound when you consider the unusually broad scope of Ryerson stocks, and the speed and dependability of Ryerson services. Buying cut-to-size steel—any kind, shape, size and quantity—gives you complete flexibility to meet quick shifts in production schedules. And you have the added assurance of getting uniform, high-quality steel—unequaled Ryerson *certified* quality.

Your Ryerson representative is well qualified to review the facts and help you get the maximum value for your steel-buying dollars. Call him any time to analyze your requirements with you.

Metalworking Outlook

Canada Gives Clue on Steel Labor

Watch Canadian labor negotiations in steel for a clue to what may happen in the U. S. next year. Algoma Steel Corp., Sault Ste. Marie, Ont., Canada's second largest producer, has signed with the United Steelworkers of America. Terms include wage hikes totaling 24 cents over the three-year life of the contract, plus fringe benefits estimated at another 3 cents hourly. But the largest producer, Steel Co. of Canada Ltd., Hamilton, Ont., is holding out and taking a strike.

Western Steel Use Recovering

Steel consumption in California, Washington, Oregon, Arizona, Nevada, Utah, and Idaho will account for about 6.6 million tons of mill products in 1959. Kaiser Steel Corp. predicts that will be 10 per cent better than 1958's usage but under the record 1957 receipts of 6.8 million tons. Major reasons behind the dip in western mill shipments this year: Reduced activity in most consuming industries and the reduction of inventories. Much of the stock cutting has been in plates and shapes.

Hawaii Industrializing

Keep an eye on Hawaii's widening industrial horizon. Its first steel mill will be operating next summer, and its first oil refinery will be producing by late 1960. Hawaiian Western Steel Ltd., headed by Philip E. Spalding Jr., will turn out 60 to 75 tons of reinforcing rods a day for Hawaiian construction and eventually will make 25,000 tons of steel yearly. A rolling mill will use steel ingots shipped from Canada. An electric furnace will melt local scrap. Facilities will cost \$1.5 million. The refinery, costing \$40 million, is being built by Standard Oil Co. of California.

What Designers Think of Auto Styles

What do industrial designers think of automotive styling? Listen to Designer Carl Sundberg who polled his colleagues: "With a couple of exceptions, 1958 was one of the saddest years in the history of auto styling. We estimate that 90 per cent of the cars were worse stylewise than in 1957. Some 60 per cent of the new cars are an improvement over '58s. All the cars that are improved have one thing in common—less chrome or more tasteful use of it. Buick . . . is one of the most improved cars. But I think a little more restraint on the rear end would have been better. I think the 1957 Imperial is still the best example of rear-fender treatment."

Productivity To Gain at Least 3%

Productivity in private industry will probably increase at an average rate of 3 or 3.5 per cent annually on a long term basis. So believes Ewan Clague, commissioner of labor statistics. Writing for a University of Michigan-Wayne State University publication, he thinks the present business recovery will lead to some good gains. He also believes business and labor should take it "a little easier" in tying wage escalator clauses to the cost-of-living

Metalworking Outlook

index. His advice: If you must escalate, base yourself on wider fluctuations in the index, or on less frequent comparisons.

Get Set for the Boom

Are you underestimating the extent of the coming boom—and making inadequate plans for plant modernization? Too many are, believes Richard S. Murphy of C.I.T. Corp., industrial financing firm. “Many manufacturers tried to get through the recession without investing in new equipment and saw the effects of that decision in dwindling profits. Today, almost one-fourth of the machine tools in use are at least 20 years old and more than 65 per cent are at least ten years old.”

Structural Steel Bookings Up

Here's an industry that's doing far better than it thought it would at the start of 1958: Members of the American Institute of Steel Construction learned last week that structural steel bookings for this year will be 400,000 tons more than expected—probably 2,650,000 tons for the year. Shipments are expected to exceed 3.5 million tons. Unlike the 1955-56 boom, which was based chiefly on industrial and housing construction, 1958-59 will be dominated to a greater degree by government work. In the first half, government business accounted for 45 per cent of the total, compared with some one-third in 1957.

Slip in Electronics

Look for 1958 output of electronic equipment and components to hit \$6.9 billion, off about \$100 million from the 1957 record. This year will be the first since the advent of television in which total electronics output did not increase. Yet expanding military production and a greater-than-seasonal upswing in radio and television receiver output since midyear are resulting in a strong second half, says the Business & Defense Services Administration.

The Peaceful Atom May Be Delayed

A variety of peaceful applications of atomic bombs (from oil development to the opening of rivers and harbors) are under consideration by the Atomic Energy Commission. The program, Operation Plowshare, could begin in the late spring of 1959, says AEC Chairman John McCone, but continued negotiations with the Russians to stop atomic tests could delay it . . . Mr. McCone says the AEC will soon sign more contracts for the delivery of uranium during 1962-66.

Communist Straws in the Wind

An increased volume of Russian steel will appear in world markets, predicts Max D. Howell, American Iron & Steel Institute's executive vice president . . . Soviet scientists report the discovery of “rich veins of excellent iron ore” in Antarctica . . . China's program to double steel production is snagged. Reason: The poor quality of pig iron coming from its primitive blast furnaces.

5 Basic Reasons why MARVEL HACK SAWS CUT-OFF MORE ACCURATELY...

The consistently accurate performance of MARVEL Heavy Duty Hack Saws is no accident. MARVEL engineers knew, many years ago, that to produce and maintain accurate cutting-off, a hack saw must be designed and built like a fine machine tool.

Some of the basic design principles built into the modern MARVEL Hack Sawing System that makes it the most accurate cutting-off method you can use are:

V-Way Design...Greater Rigidity

Upright and Saddle are precision machined and fitted to form a rigid, integral unit capable of withstanding any cutting load with no deflection or side movement.

Anti-Friction Bearing Construction

Anti-friction ball or roller bearings are used at all load carrying points. Even the strongly braced saw frame reciprocates on heavy duty, fully enclosed preloaded ball bearings which provide permanent, frictionless rigidity and true-running, straight line cutting strokes.

Minimum Blade Frame Reach

Close-coupled design and crank lever action of MARVEL Saws keeps the saw frame and blade reach very short in relation to the vertical V-ways on which the unit is mounted. This insures optimum rigidity, even under the most severe operating conditions.

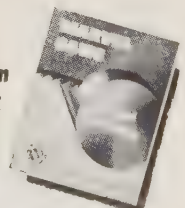

Positive Relief Blade Lift

On the return stroke, positive relief lift raises the blade to provide proper and "cushioned" lead-in on the next cutting stroke. This prolongs blade sharpness, life and accuracy.

5. Rigid Cutting Tool

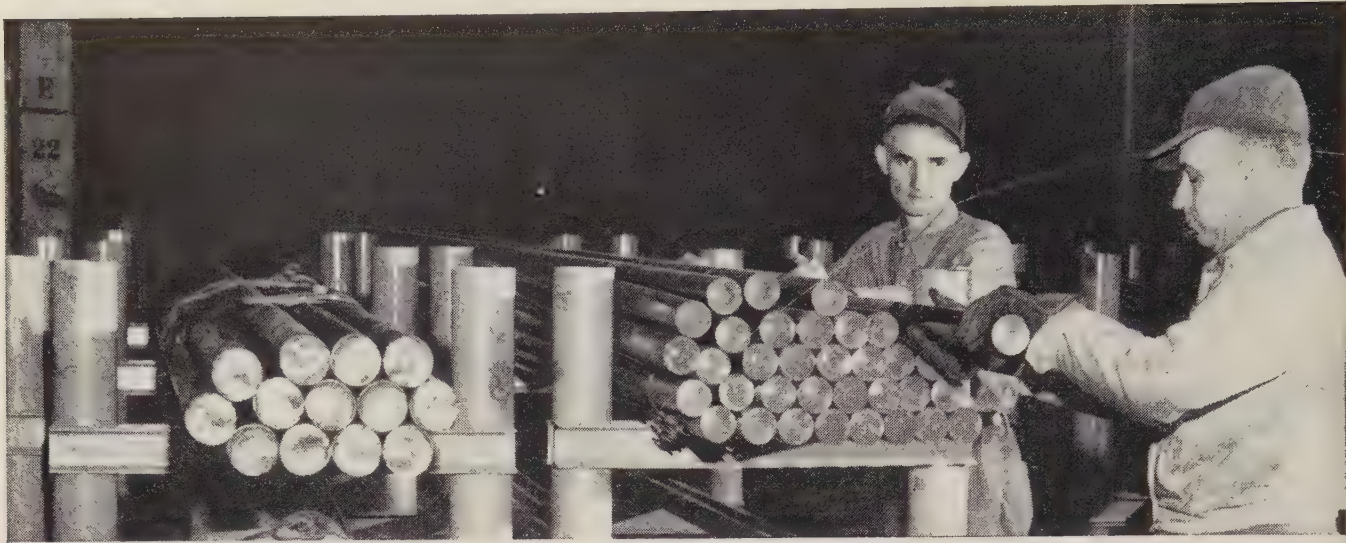

Cutting-off accuracy requires a rigidly held, relatively short cutting tool. MARVEL Unbreakable High-Speed-Edge Hack Saw Blades, which combine a narrow high speed steel cutting edge permanently welded to a tough alloy steel body, can be tensioned from 200% to 300% more taut than ordinary blades. This provides a most rigid cutting edge.

MARVEL METAL CUTTING SAWS

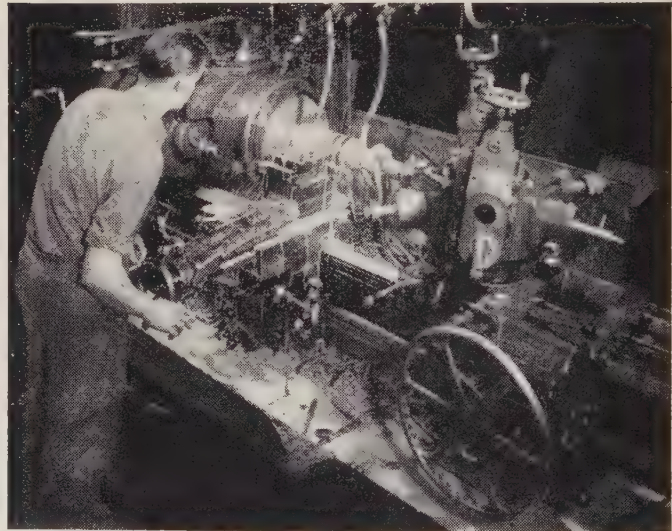

ARMSTRONG-BLUM MFG. CO.
5700 W. BLOOMINGDALE AVE., CHICAGO 39, ILL.

Metal users, save money!

simplify materials control... standardize manufacturing processes

by standardizing on two alloy steels... 4340 and 4620

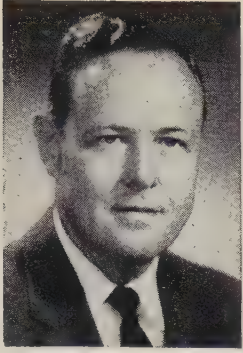

4340 THROUGH-HARDENING—Use AISI 4340 for moderate-to-heavy section parts... to get maximum strength, toughness, reliability. It's readily annealed to facilitate machining... can even be machined as heat treated in many cases. Welds readily with normal precautions. Responds reliably to heat treatment.

4620 CARBURIZING—Use AISI 4620 for all except the very heaviest duty carburized parts. It is the steel least apt to distort in heat treating. Case hardens easily with excellent case toughness. Shows uniform response to treating. You can treat mixed furnace loads... eliminate a re-heating cycle... *save more money.*

Easy to Get... Both these steels are carried by Steel Service Centers from coast to coast... ready for delivery on a "next door" basis. For a list of these sources, write: 67 Wall St., New York 5, N. Y.

Tell Your Price Story

Look for Sen. Estes Kefauver's Subcommittee on Antitrust & Monopoly to resume its attack on industry before Congress reconvenes in January. The subject: Administered prices and their alleged influence on inflation.

It's an even safer bet that the attack will be centered on the steel industry, but wherever the blow falls, now is the time for all metalworking management to get ready for the new onslaught.

The strategy is simple, yet effective. Start telling your story now, to the public and to your employees. Don't wait until the real issues are clouded by a government hearing. More importantly, use facts, not emotion. Follow the high example set by metalworking representatives at the last session of Congress.

Senator Kefauver charged that the \$6 a ton steel price increase last year cost direct buyers \$540 million; that the cost to the consumer was undoubtedly pyramided several times that amount.

In reply, Chairman Roger Blough of U. S. Steel showed that \$6 times the 64 million tons of finished steel shipped came to a lot less than \$540 million; he also showed that the dollars from increased billings—and a lot more—were needed to pay for increases in wages and other costs.

To counter the argument that improved technology offsets higher costs, Mr. Blough used the government's own figures. He showed that a 3 per cent annual increase in manhour productivity doesn't offset an 8 per cent annual increase in employment costs.

General Motors' Harlow Curtice broke down the \$125 increase in the cost of building 1958 cars to show that higher payroll costs accounted for \$52, or 42 per cent. Increased material costs, including steel, amounted to \$35, or 28 per cent; new tooling \$24, or 19 per cent; and higher local taxes and depreciation the remainder. Of the \$27 increase in steel costs, \$9 was attributed to increased weight and size.

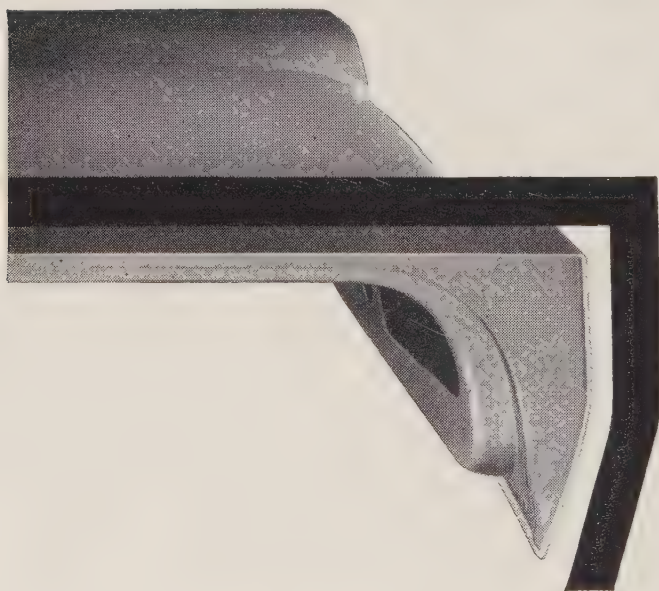

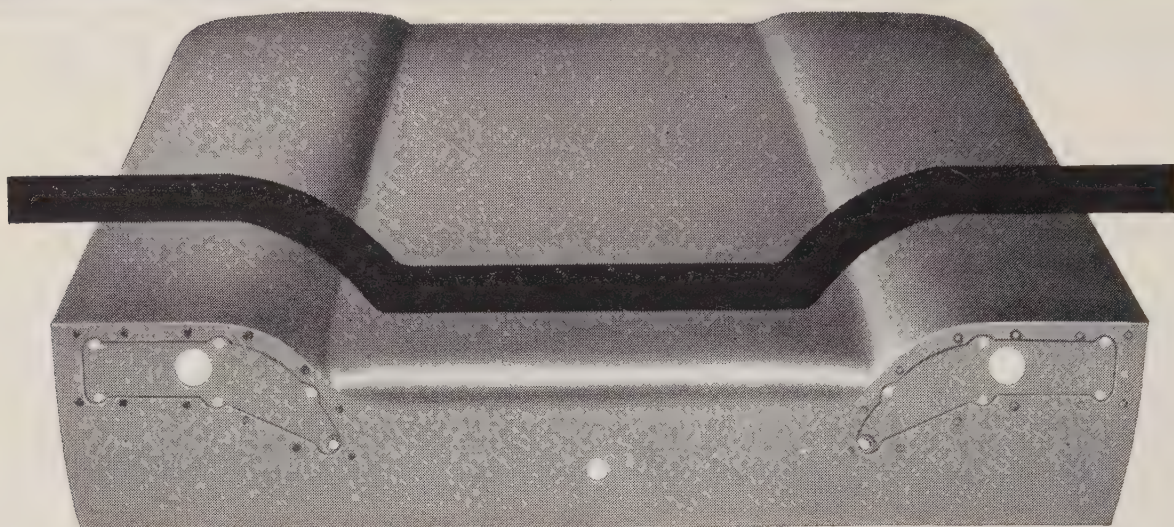

With specifics like those, industry can defeat the dangerous generalities made by political opportunists. (Even the term "administered prices" carries the connotation of conspiracy.)

The facts are there. The facts are clear. Tell them in terms of your business. Don't wait for a Congressional investigation.

*Inland "Job-Tailored"
cold rolled sheets work better*

product: AUTOMOBILE
TRUNK LID

problem:

An automobile manufacturer was having difficulty finding a steel sheet that would take the severe fabricating required to make the trunk lid of a new model. The part called for a tough draw, and the metal flow was very restricted. Finish of the steel was also an important factor. No one could provide a steel sheet that would do the job without excessive breakage.

solution:

Inland came up with a special Drawing Quality Killed Steel, "job-tailored" for this part. The steel took the difficult fabricating operation... solved the problem... and permitted the manufacturer to get his new model automobile out on schedule.

(a) Net loss. 1. Not comparable due to acquisition of Northeastern Steel Corp.

Fourth Quarter To Hit '58 Peak

THE LAST QUARTER is shaping as your best 1958 profit period far. The downtrend reversed itself around midyear, and the earnings curve is gaining altitude much faster than had been anticipated. In the third quarter, only about one out of seven companies reported higher earnings than they had

in 1957's third period. But a hefty majority showed gains over 1958's second period. For automakers and their suppliers, however, the third quarter generally brought more erosion of earnings.

• Steel — Steel industry operations rose from the 1958 low (53 per cent of capacity) during the first

week of the third quarter to a high of 68 per cent at the period's close. Earnings rose proportionately. Carpenter Steel Co. earned \$66,120 though operating at only 37 per cent of capacity.

With their eye on 80-plus operations before yearend, steelmakers predict sharp profit gains in the

final quarter. Examples:

C. M. White, chairman, Republic Steel Corp.: "The fourth quarter should show a substantial increase in shipments and earnings. Improvement will continue into 1959."

C. R. Hook, chairman, Armco Steel Corp.: "Our fourth quarter will be the best of the year." He expects Armco's last quarter operations to average more than 80 per cent of capacity (vs. 69.7 per cent for the third period).

E. J. Hanley, president, Allegheny Ludlum Steel Corp.: "Order improvement has come on a broad front. And current purchases are more closely related to production levels."

Joseph L. Block, president, Inland Steel Co.: "Our fourth quarter operating rate will be 90 per cent or more of capacity."

N. P. Veeder, chairman, Granite City Steel Co.: "Our present rate of incoming orders is higher than it has been at any time in the last two years. We expect to operate at or near capacity for the rest of the year."

• **Why Gains Loom Large**—Many metalworking executives look for fourth quarter profit gains to be greater, relatively, than sales increases. That condition can be traced to: 1. Firmer prices. 2. Better inventory balance. 3. The effect of cost reduction programs.

Stewart-Warner Corp., for example, had third quarter net earnings 8 per cent greater than in the like '57 period—despite a 16 per cent lower sales volume. Rockwell Mfg. Co. gained \$229,000 in profits on \$1.5 million less sales.

• **Depends on Detroit**—If Detroit builds 1.4 million cars in the last quarter, as predicted, metalworking's profits for the period will probably compare favorably with those in 1957's final quarter. Only 2.9 million cars were produced in the first nine months of this year.

• **Other Upturns Start**—Appliance production is picking up (see STEEL, Oct. 6, p. 41); farm equipment sales are running well ahead of last year's. The business machine industry, among the last to feel the recession, is now moving back to record levels. Rising prices are brightening the copper industry's profit outlook.

STEEL Polls Showgoers on Sales, Research, Products

U. S. METALWORKERS are expecting next year to be a good one. Sales will be increasing steadily; research and development spending will go higher; and outlays for new or modernized capital equipment will be above this year's.

Those statements represent the consensus of exhibitors and visitors polled by STEEL last week at the 40th National Metal Exposition & Congress in Cleveland. Upwards of 50,000 visitors streamed through the gates; exhibitors came from 23 states, the District of Columbia, and Denmark.

• **Optimism**—D. L. Bernhard, marketing manager, International Research & Development Co., Worthington, Ohio, voiced a general feeling at the show: "Our business will be 50 per cent better next year, if we make more of a sales effort. Sales will have to be made by ef-

fort, not just by calls."

A midwestern executive (steel castings) agreed that 1959 will show improvement, but he wouldn't buy the 50 per cent figure. "There are too many unknown factors for me to predict that much of an increase. We're looking for a long, steady increase rather than a boom."

E. H. Novak, co-owner of Cadillac Stamp Co., Detroit, adds: "We're as low (inventories) as we've ever been, but we're building up now in expectation of a damn good year next year."

• **Research**—Most of the companies queried by STEEL's editors plan to spend at least as much on R&D in 1959 as they did in 1958—and most of them ignored the recession in their R&D budgets this year.

Charles Powers, sales engineer, Zagar Inc., Cleveland, says his firm

spent more for research in 1958 than in any previous year. He adds that next year's outlay will depend on business.

William L. DeSenti, president, Mettler Machine Tool Inc., New Haven, Conn., adds that in his company "R&D spending will remain high, possibly exceed the 1958 figure." John Sedlacsik Jr., president, Ionic Electrostatic Corp., Garfield, N. J., says his firm will be spending more next year.

• **New Products**—Companies queried by STEEL revealed that products which didn't exist five years ago are making a big contribution to profits.

John H. Charpentier, sales manager, Fenn Mfg. Co., Newington, Conn., reports that 30 per cent of his company's profits come from products introduced since 1953. Others reported figures ranging from 5 to nearly 75 per cent.

Significant new developments displayed included Convair's "Dynapak" (see story on this page). The Doehler-Jarvis exhibit gave evidence of the increasing importance of diecast aluminum.

Torrington Mfg. Co. exhibited its vertical, four slide forming machine. A departure from the horizontal layout, the equipment formed a complex clip used by General Electric as a replaceable die in enameling copper wire.

Detrex's dip painting machine (combined with a degreaser) attracted interest. Viewers watched sample parts on a conveyor pass through a vapor degreasing bath, air drying, then dip into a hot paint bath contained within the degreasing chamber. Parts emerged dry.

• **Lead Steel**—Joseph T. Ryerson & Son, Chicago, introduced its new leaded steel tubing. Known as Ledloy 170, it is a cold drawn seamless product of low carbon analysis with 0.15 to 0.35 per cent lead added. Although its cost is 10 per cent higher than that of comparable tubing without lead, Ryerson spokesmen say the difference will be more than balanced by a 25 per cent productivity increase.

Several vacuum equipment builders had exhibits. Consolidated Dynamics Corp. showed its new vacuum induction furnace for heat treating, sintering, and brazing at temperatures up to 2500° F.

With this tool, you make parts in 1/1000 second, because . . .

Now You Can Explosive-Form

YOU COULD be at the threshold of your biggest production breakthroughs. Explosive forming, judged by many as one of the hottest ideas to hit the metalworking industry in a long time, is ready for commercial exploitation. (See STEEL, Aug. 25, p. 32.)

For the first time, you can buy equipment to take advantage of the process in your plant. The machines, called Dynapak, were demonstrated by the builder (Convair, a division of General Dynamics Corp.) at the Metal Show last week.

• **Potential**—Convair engineers have used the machines for forging, extrusion, forming, compacting, shearing and blanking, and extrusion casting. It will solve some of the problem jobs in these areas. It also bids fair to enhance many of metalworking's bread and butter forming jobs.

One jet engine maker has ordered a machine to forge turbine blades and buckets, hoping to get rid of all machining on the parts. A major maker of stainless steel is evaluating the machine to make a wide variety of architectural and trim shapes.

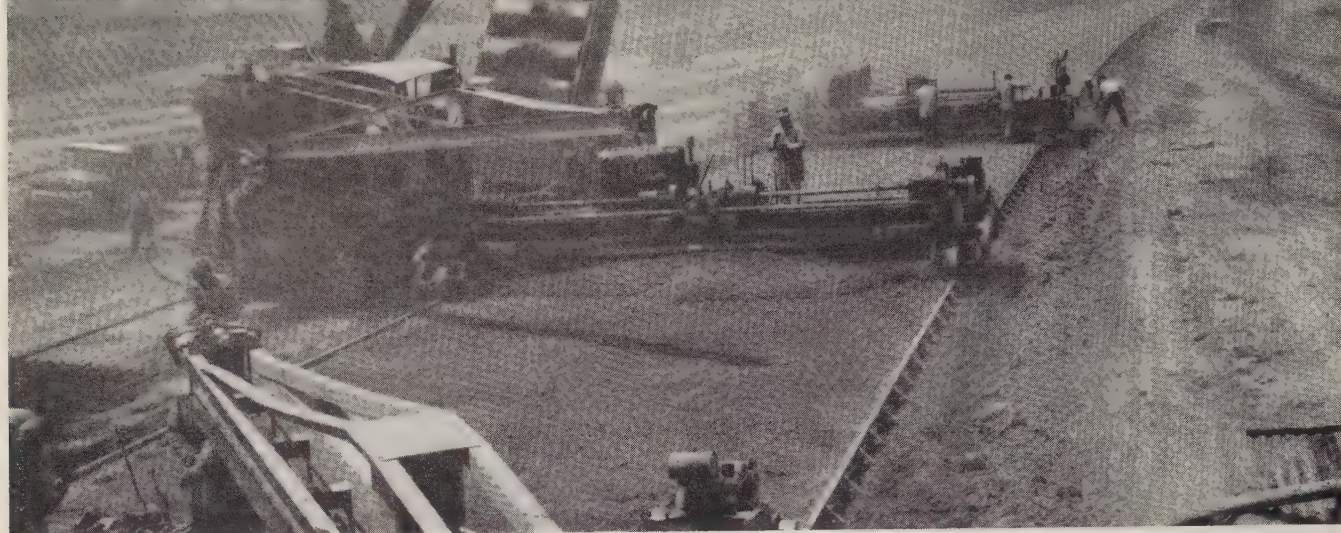

• **What It Does**—Parts formed at supersonic velocities, say up to 5000 in. a second, come out with surprising results. For one thing, part definition is nearly perfect.

Paper-thin sections can be extruded or forged (at least as thin as 0.005 in.) with no deformation or tearing. Surface finish of the part is as good as the tools. Minute draft allowances on forgings are easily handled.

• **How It Works**—The heart of the Dynapak is a gas-fired ram that's shot at the work blank or part. Depending on the size of the machine (there are three standard models), the ram delivers 40,000 to 1.5 million ft-lb of energy. The die is mounted on a dynamic reaction frame that absorbs the impact shock like the recoil action of a 5-in. gun.

It can be mounted on the shop floor, with no base, and held in place by common lag bolts.

Ralph G. Monsees, in charge of Convair's Dynapak program, says the machine is about one-fourth the size of conventional equipment of the same capacity, is inexpensive (the small Dynapak costs roughly \$18,000), safe and easy to operate.

Wire Reinforcement Institute.

\$51 Billion for Construction in 1959

YOU CAN COUNT ON construction to continue setting the economic pace next year despite tighter credit and higher costs. Estimates of dollar volume of new construction checked by STEEL range from \$50 billion to \$52 billion. Favored by most are the Labor Department's preliminary figures (see table), midway in the range. Even the lowest estimates put building at new peaks for 1959.

Repair and maintenance spending will swell the total construction picture to about \$70 billion. Economists foresee construction passing the \$100 billion mark at least by 1968, if it continues to increase its percentage of the gross national product (as it has been since 1946).

• **Trouble Spots?** — Government sources and construction associations generally discount the effects of tighter money and higher costs on construction outlays next year. H. C. Turner Jr., president, Turner Construction Co., New York, expects costs to rise. (Reasons: 1. Historically they move at twice the rate of the Wholesale Price Index. 2. The industry does not have mass production techniques available to it as readily as manufacturing firms.) But there appears to be no real advantage in postponing outlays since later ones probably would have to be increased.

• **Higher Costs**—Walter Schneider, director, construction industry division, Business & Defense Services Administration, notes employment is running about 700,000 less this year than last. The apparent inconsistency with higher dollar volume is partly caused by the use of more mechanized equipment (for highways and laying sewer and water lines, for example) and more functional designs of buildings, plus the use of more prefabricated components. He does not see costs rising more than 2 per cent next year.

• **Tighter Money**—Nor does he see any shortage of construction funds even with the Federal Reserve Board tightening credit. Arnold Chase, chief of the Bureau of Labor Statistics' construction statistics division, analyzes credit this way: "If there is no big upturn in capital expenditures by industry next year and the country's deficit in fiscal 1959 is less than the predicted \$12 billion (corporate tax receipts should be more than estimated with the economy recovering as it is), then money will not be tight."

Credit could be tight in housing, however, say some Capitol Hill sources. Also there is the chance that down payments on FHA and VA loans will be increased. Rep. Albert Rains (D., Ala.), chairman

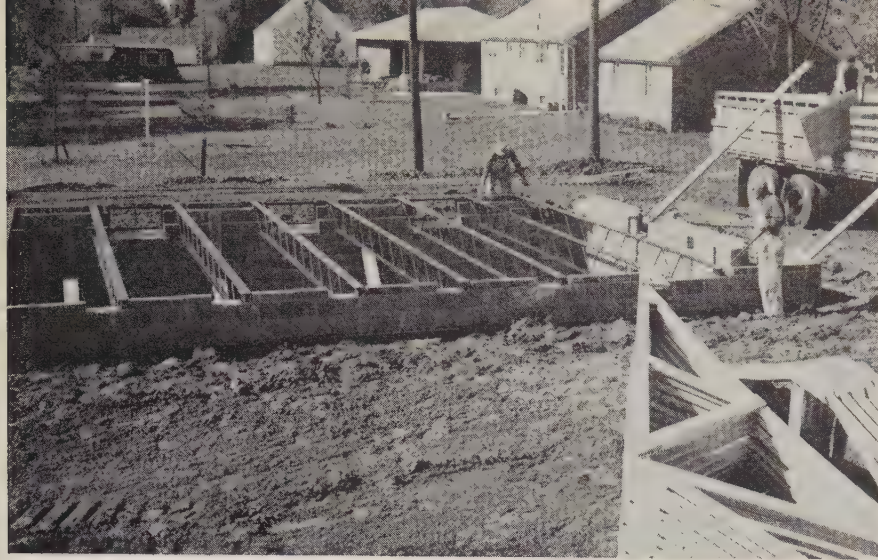

of the Housing Subcommittee, predicts a decline in housing starts next year unless another \$1 billion is voted by Congress for home loans.

• **Fight for Funds** — Introduction early next session of Representative Rains's proposal will probably start a funds tug-of-war between housing and highway interests. Highway trust fund expenditures have been exceeding receipts for the last three months, and Congress will be asked to provide funds from general revenues to keep the program on schedule.

Washington sources expect the housing bill to fail (if passed, they predict President Eisenhower will veto it), and think highways will be in trouble if the states don't go along with the administration's plan to boost gasoline taxes (which go into the trust fund).

Another battle is in prospect over federal money for airports. The President vetoed a bill this year which would have increased annual federal aid from \$63 million to \$100 million and extended the program through fiscal 1963. Chances are that he will not veto such a bill a second time, because the need for airports to meet the jet age is becoming more evident.

• **Materials Supply** — Associated General Contractors reports no de-

Modern Homes.

livery problems in steel or cement, but are a little concerned about cement next year, if highways boom as expected.

• **Labor Problems** — Jurisdictional strikes this year were off 45 per cent from those of 1957, says the AGC, but it continues to hammer at the need to stop featherbedding.

Thus with no more than the usual labor problems, better than average material supplies, an ample supply of credit, and perhaps a below-normal increase in costs, the construction industry faces its best year in history. The breakdown:

• **Housing** — Most experts think starts will fall off to 1.1 million next year, compared with about 1.2 mil-

lion this year. Mr. Chase disagrees: He forecasts an increase of about 75,000, but thinks the trend will drop off the latter part of 1959. Starts this year will carry dollar volume higher next year, even if they fall, points out Mr. Schneider.

• **Industrial**—Large projects (over \$5 million) have fallen over 50 per cent from their 1956 peak. The trend should flatten out next year, because contract awards have already turned up. Small projects (under \$5 million) have fallen rapidly from their 1957 peak, and appear stronger than large projects.

• **Commercial**—Not as many new office buildings are being started. A decline is expected next year. The

National Association of Real Estate Boards predicts a "slight lull" in shopping center building until the 1960s.

• **Farm**—A drop in farm income next year, notes Mr. Chase, will affect farm construction.

• **Utilities**—Mr. Schneider is pessimistic about railroad construction, sees private gas utilities holding their own, and electrical utilities up a little.

• **Public Housing**—The Capehart program for military housing should keep rolling, barring a cutback in funds.

• **Public Nonresidential**—A school program would help tremendously. Despite the administration's objections, Sen. James Murray (D., Mont.), chairman of the Education Subcommittee, predicts an "adequate program of classroom construction will have high priority next session." Atomic Energy Commission building will increase substantially.

• **Military** — Dispersal of Strategic Air Command bases and permanent missile installations for ICBMs will boost spending in this category.

• **Highways** — Some fabricators take on more work than they can handle, notes a Bureau of Public Roads spokesman. In some instances, the program still is not moving as fast as it could. BPR says highway construction will rise to \$7 billion next year and level off at about \$8 billion by 1962 (including engineering and right of way costs). Steel consumption will hit 3.9 million tons by 1962, compared with about 3 million tons last year.

• **Sewer & Water** — Increased spending will be required each year through the early 1960s at least.

• **Public Service**—The New York Power Authority's program insures gains in this category.

• **Conservation** — Mr. Schneider predicts it will continue to gain "at a good clip."

• **Conclusion**—Optimists think total public spending might go as high as \$16.6 billion. Pessimists regard private construction's chances of bettering 1958's output as slight. In balance, total construction can't fail to better this year's record, unless a steel strike cuts the economy back to recession levels.

Jones & Laughlin Steel Corp.

Fasteners Hang On

Even though the industry's operating rate this year is only about 70 per cent and competition is stiff, producers are sure they'll need more capacity by the mid-1960s

CONSTANT DEVELOPMENT of new uses for metal fasteners is keeping this industry in the growth column despite serious threats from other methods of joining and foreign producers.

The products of this industry (rated at \$1 billion annually at the manufacturers' level) are still the most popular means of holding practically anything together. The biggest users are the automotive, aircraft, and appliance industries.

About 2 per cent of all steel mill shipments go into fasteners.

• **Enough Capacity**—Industry officials figure that their operating rate so far this year is about 70 per cent, although it can't be tied down because of difficulty in computing total capacity.

The Bureau of the Census lists about 230 plants employing 20 or more, but officials of the Industrial Fasteners Institute say there are probably around 400 companies

which make bolts, nuts, screws, rivets, or other metal mechanical fastening devices.

Most industry spokesmen readily admit that overexpansion is one of their problems today, but they feel that demand will catch up with capacity in most lines by the mid-1960s. Then you will see another round of expansion.

• **Give and Take** — Competition from other joining methods is keen, but, generally, fastener makers aren't getting ulcers. "We've lost some markets, but we've captured others," says James G. Rayburn, vice president of Lamson & Sessions Co., Cleveland. "There is room for all types and methods of fastening."

Some sections of the industry are faced with declining markets. Both high strength bolts and welding have cut into the heavy rivet markets, and use of prestressed concrete is threatening both heavy bolt and rivet makers. But the railroad industry is still one of the biggest rivet users, and shop fabrication of structural steel continues to consume large amounts of this product.

• **Adhesives Threaten**—While most manufacturers of mechanical fasteners claim that adhesive bonding is still largely unproved for most mass production uses, it threatens to capture sizable markets in the future—especially in the aircraft and electronics industries.

A *Machine Design* study (see following page) reveals that 39 per cent of the original equipment manufacturers who responded use some adhesives; 41 per cent are in transportation; 30 per cent in machinery; and a whopping 61 per cent in instruments.

Typical of the industry's attitude toward this newcomer is the comment of George Case Jr., president of Lamson & Sessions: "As long as products have to be taken apart for repair and maintenance, bolts, nuts, screws, or rivets will have to be used for joining. But God help us if they ever find an inexpensive, quick method of disassembling adhesive bonded parts."

• **Most Serious Threat** — To keep pace with the changes in this industry, many manufacturers have had to change, too, mostly by altering their product mix or by diversifying into allied fields. But their biggest problem—imports—is not as easy to

live. The wood screw people are hardest hit.

"With wage rates in the U. S. factories from three to ten times higher than those in Europe and Asia, it is becoming impossible for domestic producers to compete in the domestic market," declares George P. Byrne Jr., managing director of the United States Cap Screw Service Bureau, New York.

In June, imports of wood screws were 38.85 per cent of domestic shipments, which was well above the 14 per cent for all of 1957. And

he claims that the wage differential is also ruining the industry's exports.

The industry is sending a constant barrage of protests to the White House, which Mr. Byrne contends "eventually should bring about a change of attitude in Congress and the White House regarding protection for our industry." But privately, company officials doubt that much will come of it. "In good times, we need imports," says one official. "It's only during recessions that imports or any other competition really hurt us."

Save with Fastener Engineering

AN APPLIANCE maker spent thousands of dollars designing, developing, and tooling up for a new model only to be stymied because he couldn't find the right kind of fastener for one multiple joining operation. He ended up paying a premium for a special bolt and nut designed for the job.

"If he had come to us in the first place, we could have shown him how he could have used a standard item by repositioning the fastener," said the supplier. "He would have saved time, money, and a lot of headaches."

- **Golden Opportunity**—"Fastener engineering offers one of the greatest areas in which management can cut costs today," declares an official of Tinnerman Products Inc., Cleveland. "Fabricators will design a million dollar product, then try to cut pennies on bolts and nuts. Result: Customer dissatisfaction when a cheap or improperly used fastener causes operating failure and a high repair bill."

Although many fastener makers offer design and engineering help, relatively few customers use it. In a study of the use of fastening devices and methods conducted by *Machine Design*, a Penton publication, 69 per cent of the respondents used some specialty items in their products. Yet only 7 per cent reported that they use the supplier's design service often, and 56 per cent state they use it only occasionally.

- **They Cost Less**—In designing a product, chances are good you can specify standard fasteners for most applications. In the *MD* study, 94 per cent of the respondents reported they use at least some off-the-shelf items, while 69 per cent said they use some specials. Of those using standards, about twice as many buy from distributors as those who buy directly from manufacturers.

To meet this strong demand for the bread-and-butter items, makers and distributors keep large stocks on hand for almost immediate delivery. Tinnerman Products alone has an inventory of over 500 million pieces of its Speed Nuts.

Other significant findings of the *Machine Design* study: Only ten respondents use nothing but custom made fasteners. Seventy-six say more than half of all their requirements are specials. Screws (such as cap, machine, set, tapping, and wood) are the most popular fasteners, being used by 75 per cent of the respondents. Nuts are used by 72 per cent, followed by washers (69 per cent) and bolts (55 per cent).

Record in Wire Rods

New production mark by AS&W mill shows demand is up for this bellwether steel product

THE UPSURGE in wire demand last month resulted in record production of the No. 1 rod mill at the Cuyahoga (Cleveland) Works of American Steel & Wire Div., U. S. Steel Corp.

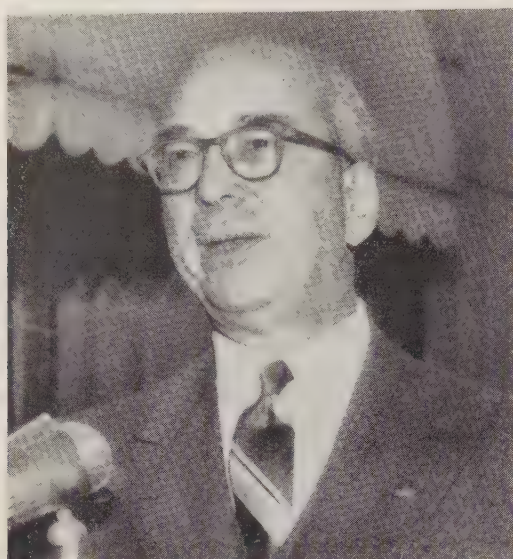

Walter L. Longnecker, manager of operations, Cleveland district, AS&W, says October's output at that mill will approximate 39,000 tons. Production per turn averaged 492 tons in the first four weeks of the month. "This surpasses any monthly turn average for this type mill," company officials report. "Previously 400 tons was considered an excellent turn average."

- **Sales Trends Spark Record**—A heftier order book and improved backlogs helped mill operators set the mark. The number of turns per week is about 20 per cent above this year's low. The mill worked 18 turns per week in October, compared with 13 to 15 during 1958's slowest months.

A midwestern wire rod supplier told STEEL: "Fastener producers, automakers, and appliance manufacturers are taking 20 per cent more wire than they required in the early third quarter. Gains in demand for this product are a welcome indicator of future business trends. We sell directly to consumer products manufacturers. Growth in our sales curve shows that the average buyer wants more finished goods."

Wire suppliers admit that order backlogs are well below peak levels. A wide variety of moderate-size orders necessitates frequent changes of rolls, with consequent loss of production time. The No. 1 rod mill at the Cuyahoga Works made 70 size changes involving downtime in the first four weeks of October. The mill rolled 53 sizes of rods.

- **Wire Gains Will Hold**—Adding an encouraging note to the outlook for wire, Mr. Longnecker reports: "We will probably continue operations at 18 turns per week in November. We haven't reached our top production in the record-breaking mill yet."

NEA

Will Strauss Change Commerce's Ways?

A TAFT REPUBLICAN will run the Commerce Department for the last two years of President Eisenhower's administration. What changes Adm. Lewis Strauss, former Atomic Energy Commission chairman, may bring to the department are among the top gossip items in Washington this week. Officially scheduled to take over Nov. 10, one of the capital's most controversial figures will continue to make headlines.

The first encounter with Congress in January when the administration seeks confirmation of Admiral Strauss's recess appointment will provide more than the usual fireworks. Leading Democrats like Sen. Clinton Anderson of New Mexico will use their influence to embarrass him when he appears before Sen. Warren Magnuson's (D., Wash.) Interstate & Foreign Commerce Committee for examination. Traditionally, Congress does not turn down a President's cabinet appointments, but the Democrats won't miss a golden opportunity to strike a blow for the Presidential campaign of 1960.

Strauss's Record Will Be Criticized

Liberals still claim the admiral did a great injustice to J. Robert Oppenheimer when the physicist lost his security clearance for atomic energy secrets. (Incidentally, another player in that drama, Gordon Gray, is the President's personal adviser on defense matters.) The new Commerce secretary will also hear about his "pressure" to put through the Dixon-Yates power contract, his "opposition" to public development of atomic power, and his high regard for secrecy in AEC matters.

Observers wonder what the admiral will think about increased help through federal subsidies for the U. S. Merchant Marine, reversal of the pay-as-you-go policy of financing the federal highway program, closer economic relations with the communist world, and a host of other problems.

If Ike had planned to finish his term in a series of political explosions, he couldn't have picked a better man than the admiral to light the fuses. The appointment is in distinct contrast to the selection of comparatively mild mannered men like Defense Secretary McElroy (who replaced fire-eater Charlie Wilson) and Treasury Secretary Anderson (who replaced National Steel's Humphrey).

Bulletin F Revisions Due Soon

Although official Treasury sources report the work of the committee to revise Bulletin F (equipment depreciation rates) is still "awaiting review," word has leaked out that a decision will soon be made publicly. Asked if he thought Internal Revenue Service would grant "realistic" rates (no more than ten years), a source close to the subject claims: "We're not planning on giving up anything we've been fighting for."

IRS is reported ready to offer a package deal in return for the revised rates: Profits from the sale of machinery will be taxed at the 52 per cent rate instead of the 25 per cent capital gains rate. If the rates are no more than ten years, machine tool interests are reported to be satisfied with that package.

New Solid Fuel Program Is Started

The Advanced Research Projects Agency is negotiating with American Cyanamid, Dow Chemical, Esso Research, and Minnesota Mining for contracts of \$1 million to \$2 million each, which will lead to an "integrated" solid fuel program. The contracts, says ARPA, are: "Unique in that the companies were given detailed specifications, but rather, end objectives. Solid fuels, now in use or under development at Pershing, Polaris, Nike Zeus, Minuteman, and upper stage rockets for space flight, have thus been given the official go-ahead so long promised by the Pentagon. Work will continue on advanced liquid fuels, particularly for our ICBM programs, but succeeding generations of birds seem to guarantee the use of solid propellents.

The granting of contracts in terms of objectives rather than specifications gives all industry the green light for tie-in developments in skins, structural and electronic components, says one source.

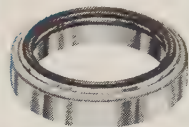

Labor Reform Bill Coming in January

Labor Secretary James Mitchell says the administration will greet the new Congress in January with a bill designed to stop the secondary boycott and "black mail picketing." The reform bill which failed in Congress this year did not provide relief from the practices, he notes. The administration's bill will include provisions assuring union members of a right to choose officers without "coercion," guaranteeing of union funds against theft and misuse, and to stamp out collusion among employers and union representatives, he says.

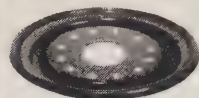

VALUE ANALYSIS where it really counts ... during design!

C/R Shaft Type Oil Seal

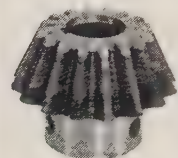

C/R Standard End Face Seal

C/R Sirvene Diaphragm

C/R Sirvis Molded Cup

C/R Rawhide Beveled Gear

Here's an expert at work, saving you money at the right time — during design. Like all C/R sales engineers, he's an experienced, well-trained representative whose knowledge springs from a solid engineering background. His ability to sit down with you during the design phase will help develop the most efficient and economical solutions to your problems.

For example, he will often suggest design modi-

fications that may save substantial production costs. Again, he will advise against specifications or seal types which he knows from experience will lead to service problems and user dissatisfaction. His personal "value analysis" of your fluid sealing problems, backed by the quality of these Chicago Rawhide products, can save you money. Welcome him when he calls to see you.

Use quality Stainless Steels ... available at your steel service center

By ordering USS Stainless Steels from a steel service center, you can avoid costly idle inventory and get delivery of the material you want . . . when you want it.

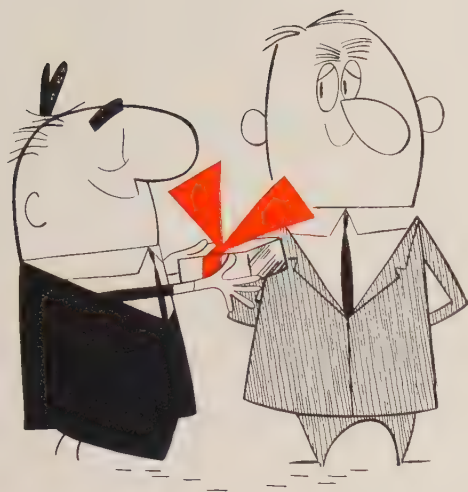

Here's your opportunity to combine the money-saving benefits of a steel service center with the fine, quality-controlled products of United States Steel. USS Stainless Steels are available right now, because of their strategically planned, wide distribution.

Remember, as a part of the American SteelWarehouse Association, your steel service center has been set up specifically to handle your immediate steel demands. So the next time you order stainless from your steel service center, be sure to specify *USS Stainless Steel*.

United States Steel

To win old customers and get new ones, Inco researches . . .

Ways To Woo the Buyer

WHAT can you do to win back markets that have been taken over by other metals.

That was the puzzle facing International Nickel Co. in late 1957 when the nickel supply situation suddenly switched from scarcity to overabundance.

• Problem—Defense needs and the national stockpile had been taking large chunks of nickel for several years. Many users had switched to substitute materials.

As defense emphasis shifted and stockpile needs were filled, plenty of nickel became available to civilian consumers. But the time was not right. The recession was in its initial stages, and new nickel deposits were being opened up.

Inco was forced to curtail production from 310 million lb a year (full capacity) to its present operating rate of 200 million lb. But stocks continued to rise: In July, inventories in the hands of Inco and the U. S. Government amounted to 35 million lb. An additional 25 million lb (estimated) were in customers' inventories.

Another problem is in the making. Inco will increase its capacity 5 million lb within three years. Other producers also plan expansions.

How do you sell more nickel under those conditions?

• Solution—Inco decided on a two-pronged approach: Encourage industry to use more nickel-bearing alloys and seek the re-establishment of specifications that had been changed when nickel was short.

Inco's battle plan: Pinpoint the markets you want to shoot for. Use a rifle instead of a scattergun in promotional and sales campaigns. At Inco, it meant: 1. Reduce the number of items on which sales emphasis is placed. 2. Make distribution outlets partners.

Inco decided to concentrate on selling alloy constructional steels containing nickel through steel service centers. The campaign's primary objective: To increase the consumption of alloy constructional steels by convincing users to upgrade—switch from the carbon steels.

Instead of trying to push a line of products, Inco's plan is to convince metal users they can simplify their inventory and plant processing problems (and save) by standardizing on Type 4340 and 4620 steels for most industrial applications which require alloy properties.

• Why These Two?—Type 4340, a general purpose alloy steel, offers maximum strength, toughness, and reliability in moderate to heavy section parts, says Inco. It believes that Type 4620 will serve in 90 per cent

of all applications calling for a general purpose carburizing steel.

To start the ball rolling, early in the summer Inco's technical field sections met with the management and sales staffs of steel service centers throughout the country to outline the campaign and enlist their support. Initial results: Over 150 steel service centers are co-operating in the Inco promotion by stocking and marketing the two alloy steels.

• Plan of Attack—Inco is using every promotional tool at its disposal to put across the "Two Alloy Steels" plan. It fired its opening gun in September: An industrial advertising campaign in 19 leading business and technical publications.

The company is also pushing the plan in its national magazine, newspaper, and radio advertising. It provides steel service centers with direct mail folders and newspaper mats for local advertising. A booklet (it lists established applications of the two alloy steels in leading industrial fields and gives technical data on their properties) has been distributed to service center sales personnel. And potential customers are supplied with a buyer's guide which names the service centers at which the alloys can be obtained.

Inco is also pushing the plan at trade shows and conventions. Finally, specialists in the company's sales staff work close with service center salesmen to keep customers informed on the advantages of the alloys.

• Wrapup—Inco believes it has found the formula for selling more nickel: 1. Convince the user that he can save money and improve his product with the high alloy steels. 2. Help the steel warehouseman increase his sales by providing him with supporting advertising, technical help, and sales leads.

August Strike Total Low

About 300 strikes began in August, the lowest total for that month in ten years. Stoppages which continued from July pushed total strike idleness to 2 million mandays, an increase over August, 1957, but lower than any other postwar August.

The 475 strikes in effect during the month involved about 250,000 workers.

Plant Superintendents Are . . .

- Responsible for production
- Adept at handling
- Willing to delegate authority
- Skilled in decision making
- Effective communicators
- Well-educated
- Active in civic affairs
- Ambitious
- Familiar with plant operations
- Well-paid

They Carry the Weight of Production

Who are metalworking's executives? The plant superintendent is a key member of the team. He's the man who gets the work out—through delegation, supervision, leadership

"MY JOB is the development of people," says George Meyer, general superintendent, Warner & Swasey Co., Cleveland. "People are the source of production which is my responsibility. With my time devoted to people, production problems have become quite secondary."

Howard Nieberding, superintendent, American Stamping Co., Cleveland, says his work is like that of a general manager. He is involved in tooling, engineering, development work, personnel problems, and setting up new plant programs.

Byrl M. Stout, works manager at the Port Allegany (Pa.) plant of Pittsburgh Corning Corp. describes his job as "operation of a plant, including such things as labor relations, production scheduling, quality control, maintaining inven-

tories." He boils it down to "seeing to it that the plant is adequately staffed, manned, equipped, and has sufficient raw materials and utilities."

William E. Bruse, works manager, Shakeproof Div., Illinois Tool Works, Elgin, Ill., says he is in charge of production, production control, inventory scheduling and shipping, inspection and quality control, metallurgical department, industrial engineering department, manufacturing engineering department, and the toolrooms.

• **The Job**—Some companies have plant superintendents; some have plant managers; some have both. Often the titles are interchangeable; sometimes not. But in all cases, some likenesses can be found.

Mr. Meyer says he is not con-

cerned with day to day activities. He delegates those responsibilities and expects his subordinates to carry them out. Mr. Nieberding believes that thorough knowledge of plant operations is one of the attributes of a good superintendent.

Mr. Meyer thinks that all superintendents or managers must have three things in common. He calls them dedication, delegation, and decision. Superintendents must be dedicated to their jobs. They must consider their work important. They must be able to delegate authority, then give the subordinate enough freedom to get the job done. They must be able to make decisions.

No matter what company the superintendent works for, he will be held responsible by his superiors for getting the work out. As Mr. Bruse puts it: It's the plant superintendent's job "to get the right people to work on their jobs with the right motives. When that is accomplished, they get the job done."

The superintendent must be able

to delegate work. He must be able to leave it delegated. But he must be ready to take the responsibility when things go wrong.

- **The Man**—Plant superintendents handle many different types of work, and, as might be expected, the type of man differs widely.

Most are not college graduates, but most are well-educated. Many, of course, are college trained and the number is growing. Educational backgrounds vary widely. Example: George Meyer has a degree in geology from California Institute of Technology.

Many superintendents are technically trained. Typical is Hotpoint Co.'s Harold Black, a graduate of night technical school and apprentice machinist courses.

What is important (and common) among plant superintendents is their desire for self-improvement. They're curious. They like to read, although most complain they don't have enough time. They get interested in civic affairs and generally encourage their men to do the same. Many are taking night school courses not directly related to their jobs.

- **The Opportunity**—Plant superintendents are managers. They're consulted on many different types of problems. They're important members of the staff.

And they're being readied for promotion. In some plants, the next step is plant manager. In some cases, men can move directly into administrative jobs.

Some men use the job to move up in the company. Some get better offers elsewhere. But it's no place for a man to rest.

It's a good job. Some men retire in it. But for those with the right background and the desire to move ahead, it's a springboard into top management.

- **On Payday**—The average plant superintendent is paid about \$15,000 annually. Most get a yearly bonus when production results warrant it.

Plant superintendents are the shock troops. They're responsible for getting the work out. They're indispensable.

• *An extra copy of this article is available until supply is exhausted. Write Editorial Service, STEEL, Penton Bldg., Cleveland 13, Ohio.*

Portrait of a Superintendent

Robert J. Dubuc is plant superintendent for the Gear Grinding Machine Co., Detroit. He is 37.

Although it's difficult to type-cast the plant superintendent, Mr. Dubuc is a representative member of his profession. He is a graduate of the University of Detroit (mechanical engineering). His background includes two years with the U. S. Navy as a lieutenant (navigation officer).

Mr. Dubuc started his working life in a Ford Motor Co. trade school (while he was still in high school). After graduation, he worked with Bendix Aviation in Detroit and rose through the ranks to foreman of the toolroom, machine shop, and welding section. He was promoted to general foreman of one of Bendix's three plants and finally to factory manager of all three. He was with Bendix for 16 years.

In 1955, he joined Gear Grinding Machine Co., where he has control of all productive and nonproductive labor and departments such as labor relations, material handling, and control. He's chairman of the plant operating committee which plans all gear grinding schedules. The company has 350 to 400 employees.

Mr. Dubuc says a superintendent in a smaller plant (about 125 to 150 employees) should earn about \$12,000 to \$15,000 per year. In a larger plant, he should earn \$20,000 to \$25,000. He adds that any salary plan should include a bonus.

Mr. Dubuc has a big voice in labor problems. Although he may have occasion to feel that plant superintendents need more authority, he has a good job and knows it. He looks upon it in the same light in which he considered earlier positions—as a step toward a better position.

He has already picked the man to succeed him if he is promoted or becomes unable to work. The choice was reached by him after consultation with top management. His heir apparent has been notified.

He considers his job a stepping stone, but he doesn't expect things to come easily or unearned. He works 45 to 50 hours a week, splits his three-week vacation into two parts.

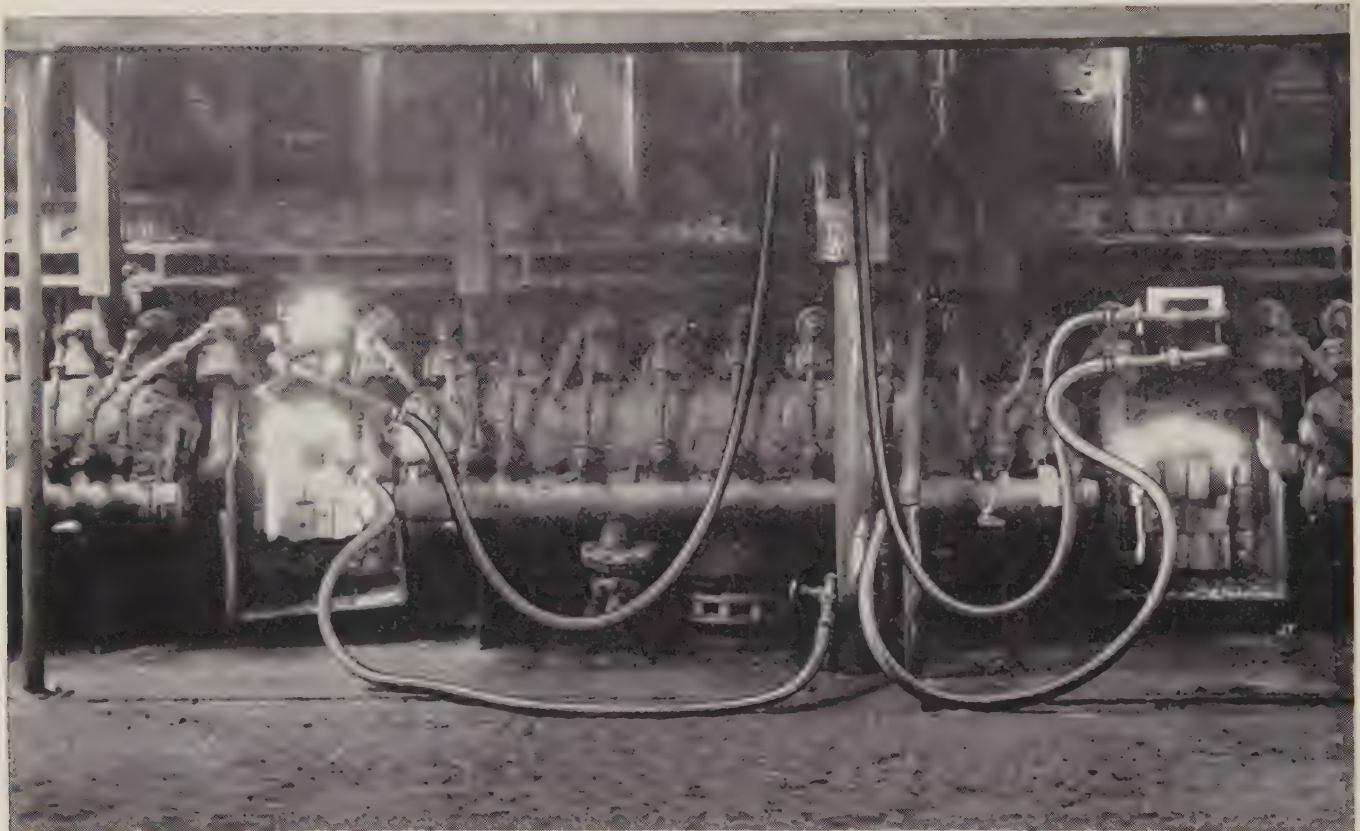

He wants to take more courses related to his job—so far, he has studied business administration, patent law, and top management cost control.

Mr. Dubuc considers his type of work to be "particularly fine training" for a man who would like to be vice president-engineering or plant vice president.

PEERLESS WATER HOSE

BIG STEEL MILL DEPENDS on U.S. PEERLESS WATER HOSE to prevent pipe skid burn

In the Fretz-Moon furnace of this Kaiser Steel Mill in Fontana, Calif., one length of U.S. Peerless® Water Hose ("the hose with the good brown cover") carries cold water to the pipe skids, another length carries the return hot water—up to 200° F. If the hose should fail or kink, the pipe skids would burn up and costly repairs and downtime would follow.

Kaiser Steel depends on Peerless to safeguard valuable

skids and keep its pipe mill in operation. U. S. Peerless is part of the complete line of U. S. Rubber's industrial hose, engineered for use and abuse.

. . .

When you think of rubber, think of your "U. S." Distributor. He's your best source of on-the-spot technical aid, quick delivery and quality industrial rubber products.

United States Rubber

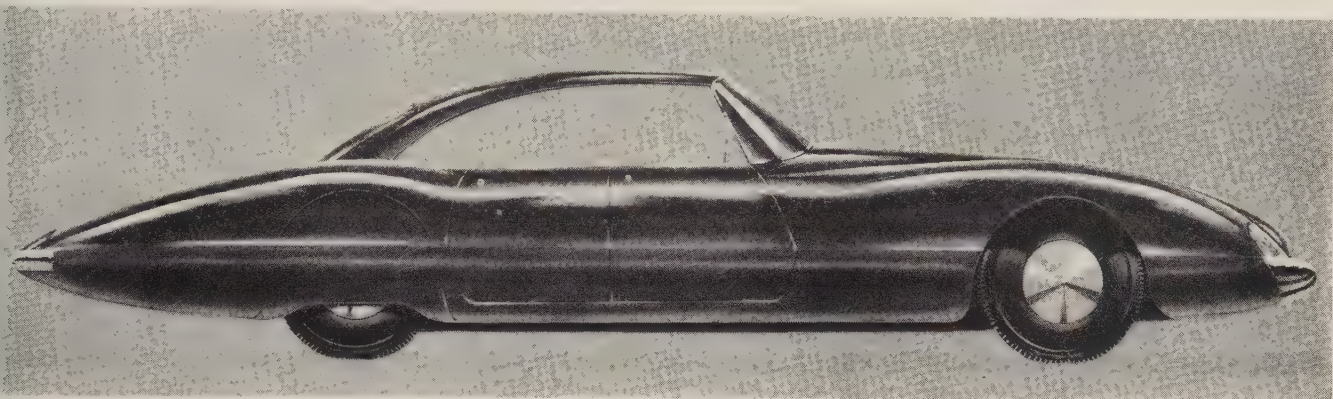

WORLD'S LARGEST MANUFACTURER OF INDUSTRIAL RUBBER PRODUCTS

Rockefeller Center, New York 20, N.Y.

In Canada: Dominion Rubber Company, Ltd.

This roadster is Argonaut's Texan

Here's Argonaut's five-passenger sedan

Argonaut Makes Its Debut

Built to last, luxury car has aluminum body and stainless steel exhaust system. Chassis is assembled in Cleveland, shipped to Italy for bodywork

FIRST they said it couldn't be built. Now they're saying it can't be sold.

With little of the hoopla attending most auto introductions, the Argonaut made its long-awaited debut in Cleveland on Oct. 22. Newsmen, photographers, sports car buffs, and prospective buyers trooped through Hotel Cleveland's lobby where they saw a gleaming white chassis, resplendent with brass radiators (for water and oil), red carburetors, aluminum spark-plug covers, and stainless steel mufflers. Body styles (see sketches

above) were displayed on easels.

• **Will It Sell?**—Admitted by invitation only, spectators sipped cocktails, chatted quietly with officials of Argonaut Motor Car Corp., and helped themselves to the hors d'oeuvres. They liked what they saw, but would they buy it?

Richard S. Luntz, Argonaut's president and chairman, thinks there's a market for an automobile of superior quality. During the last two years, he and his associates (15 stockholders) have developed a

car of the Duesenberg class. It's available in two wheelbases (126.5 and 154 in.) and seven body styles: Formal coupe, sedan, closed coupe, convertible, classic roadster (The Texan), aerodynamic speedster (Argonaut Smoke), and eight-passenger limousine. Over-all length varies from 218 to 258 in. Height is about 52 in. and track, 66 in. Price range: \$17,000 to more than \$20,000.

Assembled at a leased plant in Cleveland, the chassis has a frame of 5-in. seamless steel tubing, with 3/16-in. walls and 1/4-in. attachments (made by Overbeke-Kain Co., Cleveland). Chrysler Corp.'s Marine & Industrial Engine Div. makes the powerplant, an overhead valve V-8 with displacement of more than 400 cu in. Two transmissions are offered—manual with overdrive or three-speed automatic (Chrysler).

• **Engineering** — Boasting 50-50

(Material in this department is protected by copyright, and its use in any form without permission is prohibited.)

weight distribution, the Argonaut doesn't have power steering. The suspension system consists of torsion bars in front and low frequency semielliptic springs at the rear. Shock absorbers are individually adjustable from the instrument panel. Brakes have large capacity drums with sintered iron linings and flanges for air cooling. Twin stage master cylinders "give the effect of power brakes but afford more constant feel and increased safety," Argonaut claims.

Racing tires (8.20-15) are standard equipment and carry 35 lb minimum pressure. The stainless steel gas tank is honeycombed to prevent fuel surge and has a capacity of 32 gallons; fuel consumption is estimated at 16 to 17 mpg (at 50 mph with overdrive). Two electric fuel pumps are mounted toward the rear of the chassis. Exhaust and muffler system is of stainless steel.

Although it buys major parts from independent suppliers, Argonaut makes its own oil radiator, suspension components, and brake and gearshift mechanisms.

• **Take It or Leave It** — Asked whether a buyer might specify the mechanical components to be used in his car (make of transmission, for example), Mr. Luntz replied: "No, we don't believe the customer is likely to know the engine requirements as well as we do."

• **Aluminum Bodies**—Like custom chassis builders of the 1930s, Argonaut ships its product to Europe for bodywork. All bodies are aluminum, hand formed by two Italian coachmakers: Touring of Milan and Bertone of Turin. Since Argonauts are built to order, the buyer must choose a body style from the catalog. He won't be able to inspect it until it arrives, bolted to a chassis. The Argonaut's curb weight will be 4000 to 5600 lb, depending on body style.

Argonaut has appointed three distributors—in New York, Dallas, and Los Angeles. They'll sell the car in the U. S. through selected foreign car dealers.

• **Sales Objectives** — During its first year, Argonaut hopes to deliver about 300 cars. "We haven't accepted orders until now," says Mr. Luntz, "but we have about 75 prospects. Eventually, we hope to make

600 to 900 cars a year." Currently, the company employs 23 production workers.

Prospective buyers should be prepared to write a check for at least \$8500 when ordering, since Argonaut requires a down payment of 50 per cent. Delivery time: Seven to nine months.

Backs Aluminum Claims

Ford Motor Co. and Reynolds Metals Co. showed how their molten metal contract was working last week, and the talk naturally turned to the future use of aluminum in autos. Predicted C. H. Patterson, Ford vice president, Power Train Group: "Within five years the average car will contain from 100 to 120 lb of aluminum. I think I am taking a conservative approach."

Mr. Patterson points out that the average '57 Ford used 35 lb of the light metal. The figure jumped to 52 lb in 1958. The 1959 Fairlane 500 contains 68 lb.

• **Warning**—This is the second time within a month that a major auto company has pointed out that automakers plan to increase their usage of aluminum greatly. Dr. Robert F. Thomson and Darl F. Caris, General Motors research en-

gineers, earlier told members of the Gray Iron Founders' Society that industry must: 1. Find ways to improve gray iron castings. 2. Develop diversified product lines. 3. Or prepare to include aluminum casting facilities in their foundries.

The reason for aluminum's rapid rise is explained by David P. Reynolds, executive vice president of Reynolds: "We are designing for aluminum rather than using the primitive approach of direct substitution for common materials with traditional methods."

That's basically what makes the final cost of finished aluminum parts as cheap as similar parts made from less expensive, but heavier metals that require more machining or handling. In addition, the molten metal contract between Ford and Reynolds has set a pattern for aluminum buying that automakers will find difficult to resist. Chevrolet has a similar contract with Reynolds at the GM division's Massena, N. Y., plant. Deliveries will start in a few months.

• **How It Works**—Ford's 220,000 sq ft casting plant at Sheffield, Ala., has been in operation since mid-year. Its 83 die and permanent mold casting machines are turning out 67 auto parts. Biggest: A 24-lb transmission housing used on Ford's two-stage automatic transmission.

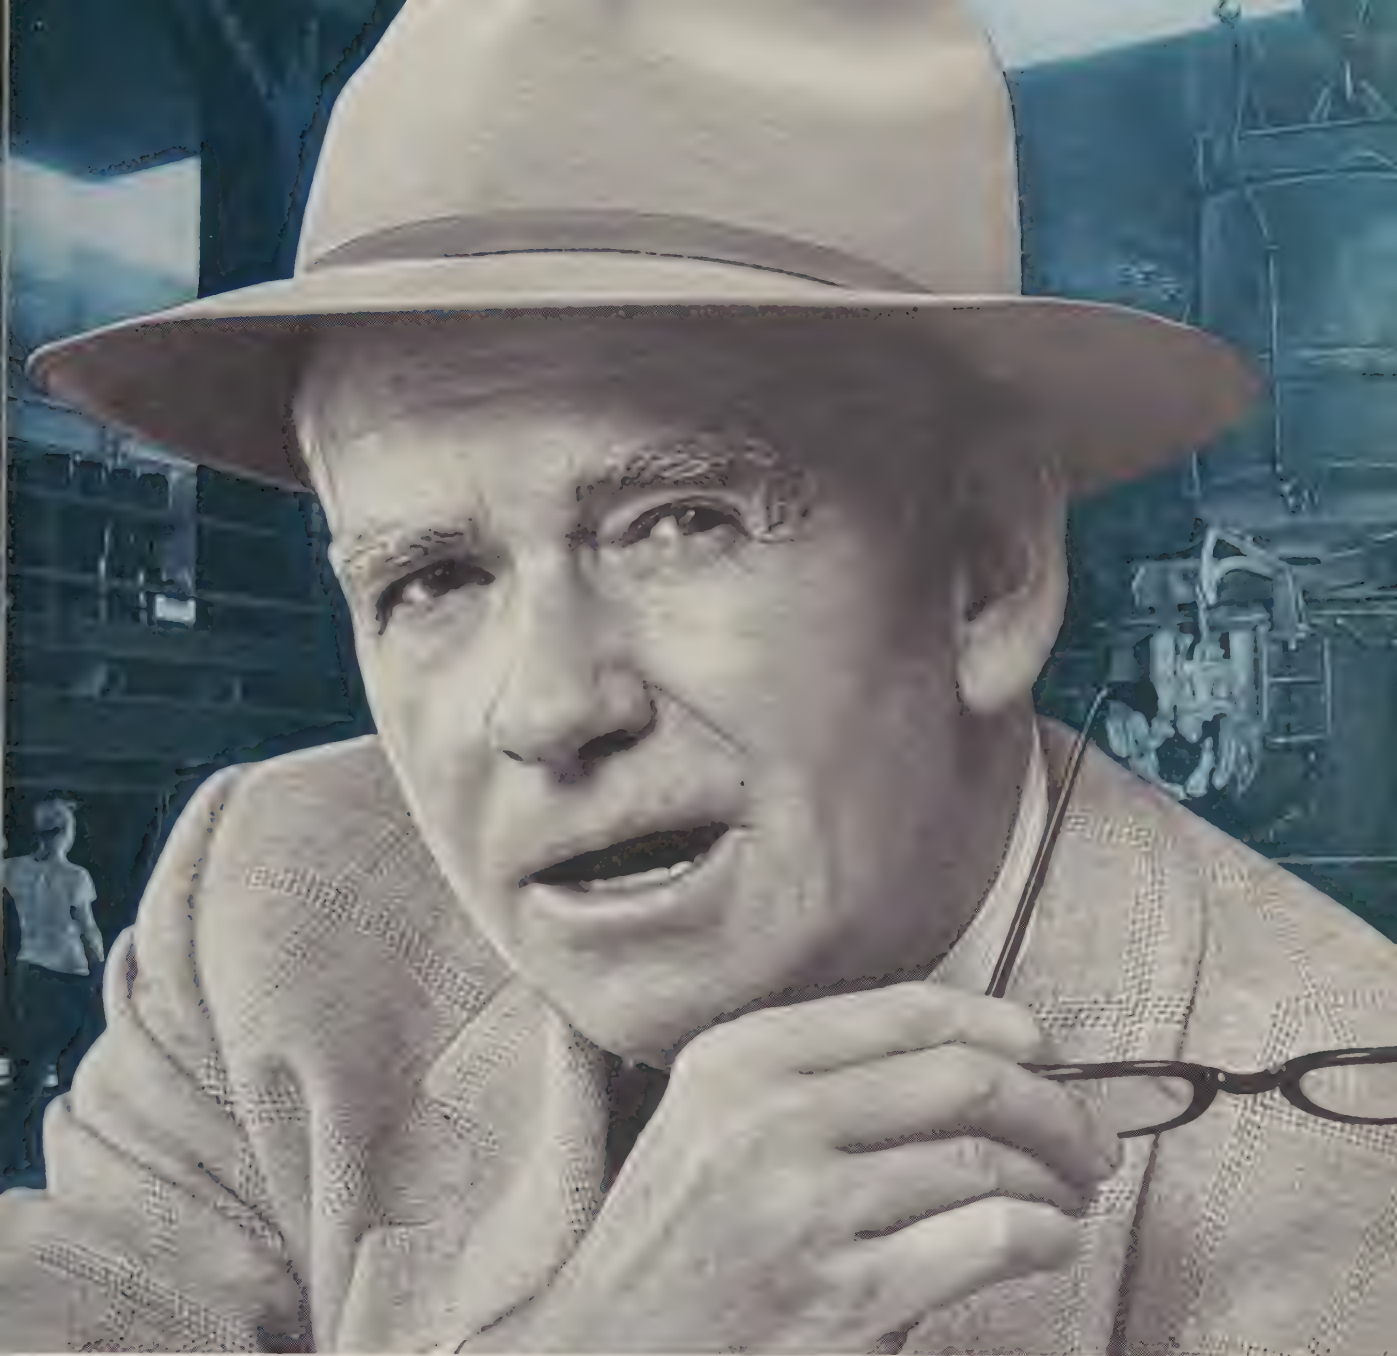

The aluminum comes in hot metal buggies from Reynolds' Listerhill, Ala., reduction plants. Ten truckloads, each consisting of two 5000 lb ladles of molten metal are delivered to the Ford plant every 24 hours, seven days a week. The contract calls for delivery of 640 million lb of aluminum over a ten-year period, a maximum of 150 million lb annually.

• **Expansion** — Reynolds has just completed a second reduction plant in the Muscle Shoals area to handle Ford's growing requirements. It cost \$70 million. Capacity of both plants totals 190,000 tons a year. Much of the aluminum is used in Reynolds' Listerhill alloys plant where a \$65 million expansion will give the company a yearly finishing capacity of 300,000 tons by 1960. Equipment installations will include a 70 in. wide breakdown mill and a hot mill that Reynolds claims will be the world's largest.

"I stock only one high-carbon chrome—refined charge chrome"

Steel mill and foundry operators are cutting chromium costs by using ELECTROMET's new refined charge chrome for all high-carbon chromium additions. Inventory, handling, and storage are greatly simplified by stocking only this one high-carbon chromium alloy. It is ideal for use as:

- A base charge for stainless steels.
- Final additions for aircraft, bearing, and tool steels.
- Cupola or ladle additions for cast iron.

Refined charge chrome combines the economy of regular charge chrome with the maximum cleanliness and low residual element content of conventional high-carbon ferrochrome. For facts on how refined charge chrome can reduce your costs, contact your ELECTROMET representative.

ELECTRO METALLURGICAL COMPANY, Division of Union Carbide Corporation, 30 East 42nd Street, New York 17, N. Y.

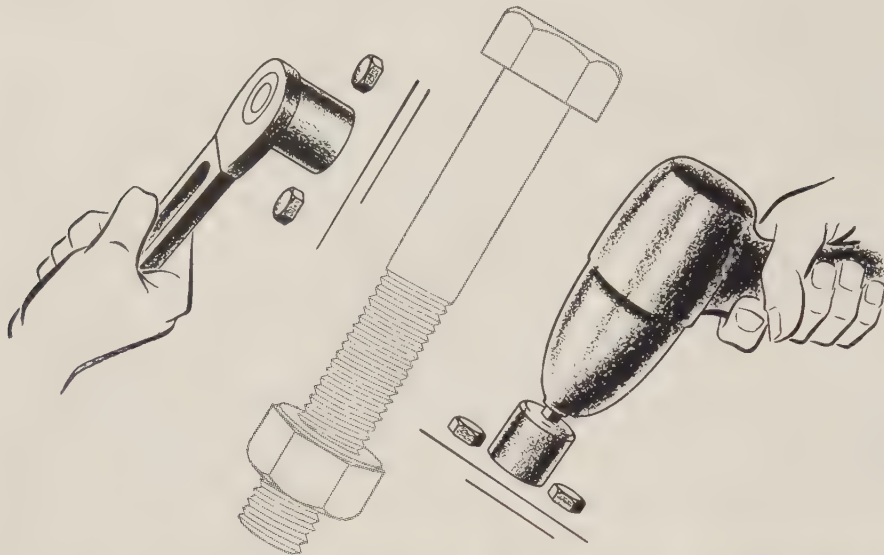

Convenient 20- and 40- pound pigs of refined charge chrome are magnetic, allowing easy handling with an electromagnet.

Electromet
FERRO-ALLOYS AND METALS

The terms "Electromet" and "Union Carbide" are registered trade-marks of Union Carbide Corporation.

TIGHTEN UP FASTENERS TO TIGHTEN DOWN ON COSTS

● Too little tightening wastes fasteners' strength—invites failures

● Proper application saves on material and production costs

Go the limit in tightening bolts. You'll find this not only more economical, but safer too. For the strength of a rigid connection depends not on how strong a bolt is, but rather on how much *clamping force* it exerts when tightened.

Example: A bolt good for 20,000 pound load is tightened to just 5,000 pounds tension. Believe it or not, *joint* strength from that bolt would be only 5,000 pounds.

Case History: Earthmover's bucket kept coming loose. Bolts were upgraded progressively, finally to alloy steel and to 1¼-inch size . . . to no avail. Trouble was they still were not being adequately tightened. Bigger wrench, more torque and standard ¾" RB&W high tensile bolts stopped problem, saved money.

Obviously, the more of the fastener's strength you use, the smaller

it can be. That's why RB&W High Tensile Bolts are such good buys. They have more strength to give. They cost less than the larger machine bolts or bright cap screws they can replace. Moreover, smaller bolts mean smaller holes to drill or tap. Smaller holes can often mean reduction in size of fastened members.

For a penetrating, productive value analysis of your fastening operations, make use of an RB&W Fastener Man. You may be surprised at the cost cutting his experience makes possible. Russell, Burdsall & Ward Bolt and Nut Company.

Economical lock nut

Staking opposite sides of these RB&W acorn nuts deforms threads for a positive grip. It also puts middle of nuts slightly out-of-round, for a spring tension locking effect. They're designed for applications such as outdoor furniture, where anchoring fasteners is more important than solid seating. Available in aluminum, steel, silicon bronze.

These all-metal nuts can also be furnished in double chamfered style. Since they lock with their middle threads, they can be turned onto screw from either side.

Silicon bronze fasteners combine desirable features

Silicon bronze offers the highest conductivity in fasteners able to withstand high stresses. It resists corrosion, stays free from season cracking, too. It makes ideal fasteners for electrical use where tensile strength is important; or for corrosive environments.

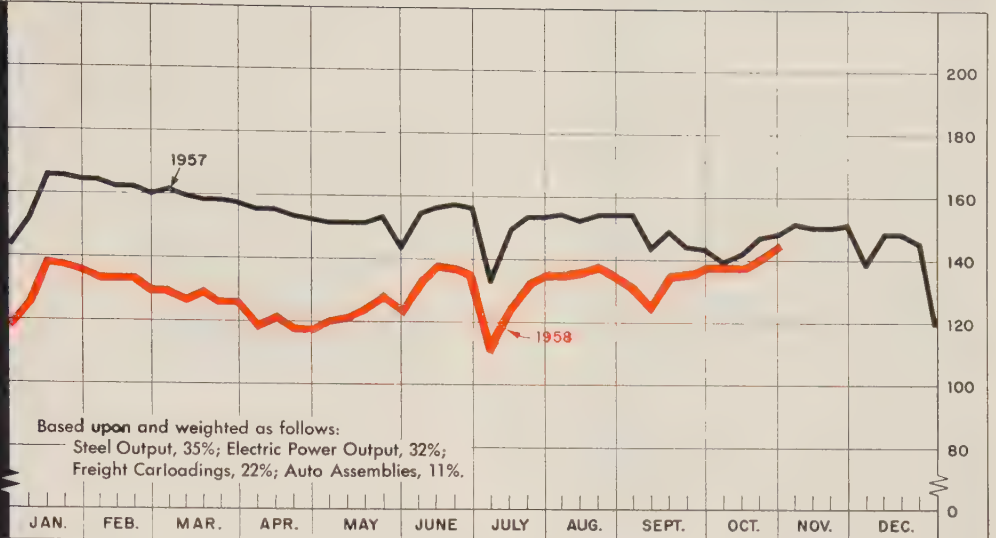

One of the first to develop such fasteners, RB&W cold works them for tensile strength and for clean, well formed threads that don't seize. Oval bolts, hex bolts and nuts, and U bolts available. Specials can be developed.

Broad Base Spurs Business Recovery

THE SHARPEST RECOVERY in the postwar era has been a team effort. While certain segments of the economy—steel, appliances, construction, consumer income and spending—have been outstanding, reports just in from about a dozen durable goods industries indicate that the base has been broader than most people realize. Gains have not been large in some cases, and in others it has been a matter of staying even after months of decline. But the net effect has been a recouping of two-thirds of the ground lost during the recession. (See graph above.)

• **Industrial Furnaces — Up** — Net orders in September rose 37 per cent from the August level to \$4,846,000, reports the Industrial Heating Equipment Association Inc. It was the second highest level of the year and well above the September, 1957, level. Orders for induction heating equipment were the highest this year, rising 233 per cent above the August level. But industrial and induction equipment are still considerably behind the cumulative year-ago totals.

• **Compressor Bodies — Up** — July shipments were less than 3 per cent below the year-ago figure, leaving the gap between current and year-ago monthly figures the narrowest so far in 1958. During the first

four months of this year, the deficit averaged 25 per cent, says the Air-Conditioning & Refrigeration Institute.

• **Structural Steel — Up** — Both bookings and shipments of fabricated structural steel gained in September, says the American Institute of Steel Construction Inc. Book-

ings were 13 per cent above the August level—16 per cent ahead of the corresponding figure for 1957. While shipments were 5 per cent better than the August total, they were 25,000 tons short of the year-ago figure.

• **Used Machine Tools—Up**—Sales of used machine tools in September

**now we're
getting
some place!**

We're making solid gains in the fight against cancer, in the research laboratory, in the hospital and in the home. Ten years ago medical knowledge was able to save only 1 in 4 lives — today it's saving 1 in 3.

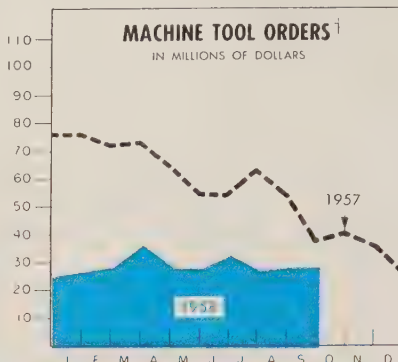

New surgical techniques, diagnostic methods, and an informed public are important reasons for these gains.

More and more people have learned that many cancers are curable if detected in time. And, sensibly, more and more people have formed the life-saving habit of an annual health checkup. They know it's living insurance against cancer!

American Home Laundry Mfrs. Assn.

surged 21.7 per cent over the August total to nearly match the July rise which signaled the end of the recession for this industry. Incomplete reports on October sales indicate that the trend continued, says R. K. Vinson, executive director, Machinery Dealers National Association.

• **New Tools—Even—**Net new orders for cutting and forming tools in September remained at the \$28 million level, while shipments advanced to \$35.1 million, vs. August's \$29.8 million, reports the National Machine Tool Builders' Association. (See graph and table, above.) This is about average for orders this year but considerably below the average for shipments due to a higher level at the beginning of the year.

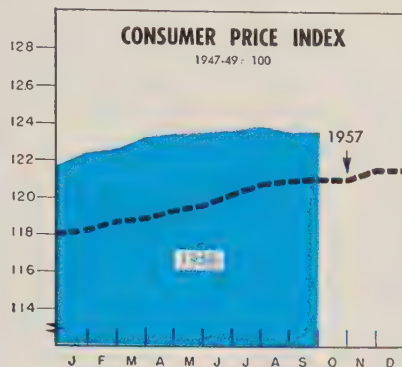

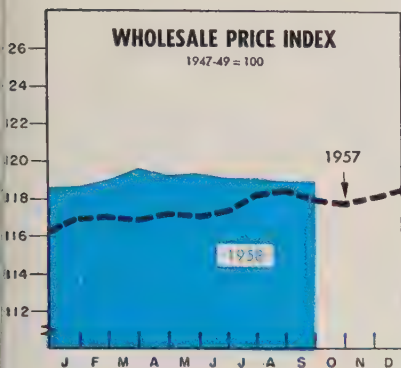

• **Furniture — Even—**While shipments and orders for furniture have leveled off at about 11 per cent under the year-ago figures, the workweek in the industry moved up to 40 hours in September for the first time since November, 1957. The National Association of Furniture Manufacturers Inc. says the kitchen and metal furniture groups led the industry with workweeks of 43.7 hours.

• **Freight Cars—Down—**Although September awards for freight cars declined to 1582 units, vs. August's 1773 units, it was the second best month of the year. Shipments continue to outrun orders, though, reducing the backlog to 24,982 cars, says the American Railway Car Institute.

Appliance Plants Busy

The appliance people also racked up some pretty impressive gains during September. The Gas Appliance Manufacturers Association Inc.'s tabulation shows that every product category showed month-to-month gains, and most showed an increase over the year-ago period. Cumulative shipments for gas fired central heating equipment through nine months of 1958 were 9.5 per cent ahead of the corresponding 1957 period. Ranges are still 9.8 per cent behind, but they rose to the year's high of 186,900 units. Water heaters advanced to 230,600 units to raise the cumulative edge over 1957 to 2.7 per cent.

Electric appliance production has also been strong. Industry sales of refrigerators reached 294,800 in September. It was the second best performance of the year and almost

Top-Hat Quality IN Perforated Metal

The popular Diamond Perforated-metal patterns shown above are only a few of the many illustrated and described in our 32-page Catalog No. 39. All of these standard patterns are available in a wide range of unit-opening sizes and we are always equally pleased to quote on original designs of any type or size.

Catalog 39 also illustrates and describes our high-quality lines of Ornamental Cane, Perforated-Metal Sheets for Acoustical installations and Heavy-Duty Architectural Grilles. Write, today, for a free copy.

Correspondence is especially invited regarding ANY requirement for perforated-metal panels or parts. We are equipped to fabricate special sections to any desired extent and welcome opportunities to make money-saving suggestions.

DIAMOND MFG. CO.
WYOMING WILKES-BARRE PA.

Manufacturers of DIAMONTEX, the Perforated Metal Lay-In panel for better Acoustical Ceilings. New Bulletin No. 47, gives complete information. Write, today, for free copy.

Construction Does It Again

To top off this review of industrial resurgence, F. W. Dodge Corp. announces that contracts for future construction showed the biggest year-to-year gains of 1958 in September. The total (\$3,315,919,000) was 26 per cent above the September, 1957, figure, the third month in a row to show a gain of better than 20 per cent. It also marked the fifth consecutive month to go over the \$3 billion mark, an unprecedented feat (see Page 42).

The weekly reports of heavy construction contracts by *Engineering News-Record* (see Barometers of Business, Page 57) indicate that the pace may have let up.

Index on Rampage

Watch STEEL's industrial production index climb the next few weeks as the auto industry goes into high gear. The 4-point gain for the week ended Oct. 25 (preliminary 146 per cent of the 1947-49 base) was accounted for almost entirely by the carmakers. Steel output and freight carloading scored an assist, with output of electric energy in the normal seasonal dip.

30,000 units above the September, 1957, mark. While range sales were slightly off the year-ago mark, they still showed a 41,300 unit improvement over the August figure. Sales of farm and home freezers, water heaters, dishwashers, and food waste disposers all rose above the year-ago levels, says National Electrical Manufacturers Association.

Every one of the products watched over by the American Home Laundry Manufacturers' Association gained in September (see graph and table, Page 58). Total shipments came to 601,612 units—34 per cent better than the August figure and 4 per cent better than the September, 1957, mark. Biggest gainers were washer-dryers (up 45 per cent over the prior month) and electric dryers (up 52 per cent).

Vacuum cleaner sales in September rose from August's 280,226 to 299,618 units, almost equal to the corresponding year-ago mark, reports the Vacuum Cleaner Manufacturers Association.

Shipments of television receivers from factories to dealers in August advanced sharply over July's figure and edged out the year-ago mark, states the Electronic Industries Association.

THE BEST INDUSTRIAL FASTENER FOR THE MONEY

Helical spring washer
of quality cold drawn
steel. Rotates but will
not come off.

FEATURES FOR FASTER PRODUCTION

EATON-RELIANCE SPRINGTITES®

Eaton-Reliance Springtites and Sems* are made to satisfy the needs of modern, high speed production in almost every field of metal fabricating. From design to final use, these fast fasteners offer features required by design and industrial engineers to make better, longer lasting products. With quality cold drawn steel as a foundation, Eaton-Reliance Springtites and Sems are headed and threaded on precision machines; the spring washer is added as a permanent part of the fastener and all

work is inspected with a critical eye toward perfect performance under the most trying conditions. Products fastened with Eaton-Reliance industrial fasteners stay "factory tight" longer. Send for Engineering Bulletin S-49, or for threadcutting Springtites and Sems in Types 1-23-25, send for Engineering Bulletin S-49-A.

RICHARD E. MCGINNIS
Gregory Industries v. p.

GEORGE E. MCCREERY
Mac-it Parts sales mgr.

D. R. BERG
Dravo's new product mgr.

O. L. WIGTON
Hancock marketing v. p.

Richard E. McGinnis was appointed vice president-sales, **Gregory Industries Inc.**, Lorain, Ohio. George E. Gregory Jr. was elected financial vice president and treasurer. Leonard C. Barr was elected executive vice president. Robert J. Kilmer, former financial vice president and treasurer, was named vice president-trade relations.

Mac-it Parts Co., Lancaster, Pa., appointed George E. McCreery sales manager for its line of socket screw products. For the last six years, he has been manager of Mac-it Screw Div. He had served Strong, Carlisle & Hammond Co. Inc. for 18 years.

York, Pa., Div., **Borg-Warner Corp.**, appointed Emil Peslar vice president and general works manager, Grant-ley Works, at York; S. S. Meadows, vice president and general manager, Decatur, Ill., Works. Mr. Peslar was vice president and plant manager, Marvel-Schelber Products Div. at Decatur.

Howard Freyensee was appointed manager of sales, large excavators, **Bucyrus-Erie Co.**, South Milwaukee, Wis. He succeeds L. C. Black, recently named manager of domestic sales. Mr. Freyensee formerly was sales development manager, commercial cranes and excavators.

E. W. Schilling was elected president, **Peerless Wire Goods Co. Inc.**, Lafayette, Ind. He succeeds his father, the late Ernest H. Schilling. Harold H. Clegg was elected secretary-treasurer, succeeding Charles D. Wiselogle, who remains as vice president-sales.

D. R. Berg was appointed manager, new product development department, **Dravo Corp.**, Pittsburgh. He joined the company in 1938. Most recently he supervised product development for the machinery division.

H. Merrill Bowman joined T. B. Wood's Sons Co., Chambersburg, Pa., as vice president and director of sales. He succeeds Gordon M. Henderson, vice president, who will assist the president in administrative and production operations. Mr. Bowman was formerly vice president of American Pulley Co.

Frank P. Lucier was appointed sales manager, **Stanley Electric Tools Div.**, Stanley Works, New Britain, Conn. Elmer W. Ellsworth was named northeastern regional manager.

W. A. Black, chief engineer, steel and tubes division, **Republic Steel Corp.**, was appointed assistant director of research in charge of activities at the Electro-Mechanical Research Center, Cleveland.

George L. Teller was made purchasing agent, foundry products and supplies, **Allis-Chalmers Mfg. Co.**, Milwaukee. He succeeds Fred K. Schroeder, retired.

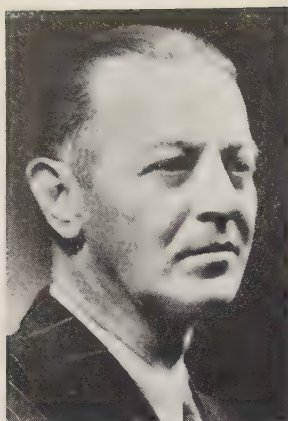

John E. Johnson was named manager, marketing department, electronic data processing division, **Radio Corp. of America**. He has headquarters at Camden, N. J. He formerly served as marketing vice president for Datamatic Div., Minneapolis-Honeywell Regulator Co.

O. L. Wigton was named to the new post of vice president-marketing, **Hancock Industries**, Jackson, Mich. For the last 12 years, he was general sales manager of Ford Motor Co.'s tractor and implement division, and central regional manager, Edsel Div. Mr. Wigton will co-ordinate and direct planning, marketing and sales of Hancock's two divisions in the East and two subsidiaries on the West Coast.

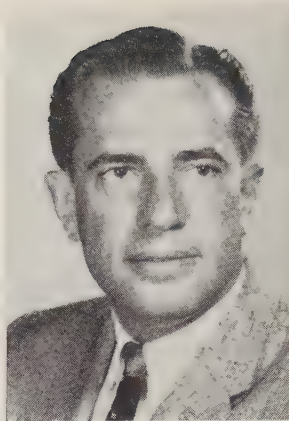

Louis E. Walz was named director of sales, **Taller & Cooper Inc.**, Brooklyn, N. Y., subsidiary of American Electronics Inc. He was manager for industrial sales at American Bosch-Arma Corp. Benjamin Z. Ranan was made director of manufacturing. He was chief industrial engineer, Sonotone Corp.

Bernard E. Magette was appointed general sales manager, **Universal Mfg. Corp.**, Zelienople, Pa. He was sales manager, Resolite Corp.

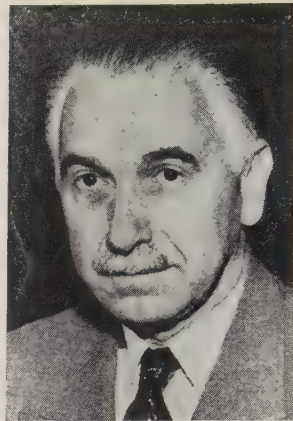

Raymond E. Calhoun, former sales manager, metal container division, **Jeta Metal Fabricators Inc.**, Yonkers, N. Y., was made commercial sales manager for both metal fabrication products and the new power equipment. David Lavker was made manager of government sales and contract administrator. Michael Campagnale, former plant superintendent, Atlantic Diesel Mfg. Co., Hamburg, Pa., was named manufacturing manager, and retains his post of chief engineer for power equipment. Joseph Ascher was made chief engineer, metal fabrications; Lewis Balletto, purchasing agent for all Jeta division; Nicholas

Chrysler Corp., Detroit, automotive sales group, appointed: **A. B. Nielsen**, executive assistant to group vice president; **William J. Bird**, assistant general sales manager, general sales office.

Donald R. Spatz was promoted from vice president and general sales manager to president and general manager, **Pesco Products Div.**, Bedford, Ohio, and the **Wooster, Ohio, Div.**, Borg-Warner Corp.

D. W. Boyles was appointed assistant purchasing agent for the northwest division of **National Supply Co.** He has headquarters in Casper, Wyo.

Ronald J. R. Kallman was named to the new post of western regional manager, Transac computer systems, by **Philco Corp.**'s government and industrial division. He has headquarters at Philco's western development laboratory, Palo Alto, Calif.

Robert J. MacDonald was appointed head of the bearing and friction materials section, mechanical research division, **Clevite Research Center**, Cleveland. He was with Battelle Memorial Institute.

Ralph A. Shonk was made vice president and general manager, **General Refractories Co. of Canada Ltd.**, Smithville, Ont.

Emil A. Vierow was appointed assistant to the manager of the Youngstown district of **Youngstown Sheet & Tube Co.** He was superintendent of fuel and power.

Dr. Erwin A. Horiak, chief engineer, **Hercules Motors Corp.**, Canton, Ohio, was named director of engineering. Assisting him will be: **J. L. Biasetti**, chief engineer; **Harry Cuthbert**, chief engineer-advanced engineering, in charge of new product development; **Robert E. Kerr**, in charge of experimental laboratory activities.

Franklin H. Schultz was appointed director of purchases, **Haughton Elevator Co.**, division of **Toledo Scale Corp.**, Toledo, Ohio. He was assistant to **Everett W. Curtis**, retired.

Walter M. Northey was appointed general superintendent, **Gulf States Tube Corp.**, Rosenberg, Tex., subsidiary of **Michigan Seamless Tube Co.** He joined **Michigan Seamless Tube** in 1956, and has served as plant superintendent.

Joseph Wheeler Jr., New York regional sales manager, was elected a vice president of **Johnson Service Co.**, Milwaukee.

John Kozak was made chief engineer, **Hall-Toledo Inc.**, Toledo, Ohio. He succeeds **George Aberl**, resigned.

George E. Wind was appointed assistant service manager, **Clearing Machine Corp.**, division of **U. S. Industries Inc.**, Chicago.

Capewell Mfg. Co., Hartford, Conn., appointed **Royal A. Wilson** as Michigan district manager.

Jack M. Schultz was named manager of technical sales, pigment division, **Aluminum Co. of America**, Pittsburgh.

Don Johnson was promoted to sales manager of **Almco, Queen Products Div.**, King-Seeley Corp., Albert Lea, Minn. He was Detroit branch manager, and is succeeded by **Al Sartor**. **Bruce Hardin** was made sales engineer, Michigan area, and is in Detroit.

Richard H. Lewin was appointed president, **Lewin-Mathes Co.**, St. Louis, division of **Cerro de Pasco Corp.** He succeeds the late **Felix S. Dreyer**. Mr. Lewin was executive vice president.

Mansfield D. Sprague was elected vice president for public and industrial relations, **American Machine & Foundry Co.**, New York. He was assistant secretary of defense for international security affairs.

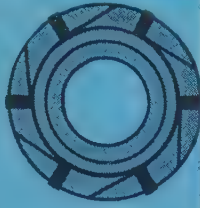

Manuel Tama was elected president, **Ajax Engineering Corp.**, Trenton, N. J., to succeed **Dr. G. H. Clamer**, now chairman. **Mario Tama** was elected vice president.

F. H. Kirkpatrick was named assistant to the co-ordinator, production control, **Allegheny Ludlum Steel Corp.**, Pittsburgh. He was manager of the production control department at the Brackenridge, Pa., Works. He now succeeds **E. G. Painter**, recently named co-ordinator, production control.

Thomas A. Claiborne was appointed southwest district sales manager at Houston, newly established sales district for **Tennessee Products & Chemical Corp.**, and the parent company, **Tenn Tex Alloy Corp.**

Robert Curtin was appointed Chicago district manager for **Wall**

QUALITY

PRODUCTS

Serve Millions Of Americans

In razor blades and refrigerators, in clocks and cars, in hand saws and industrial tools, in chemicals and candy...almost anywhere you look, Americans use Sandvik products.

From coast to coast, Sandvik's consistent product quality and specialized service benefit both industry and the individual consumer. That's the reason why Sandvik has been growing with America since 1878.

CHARLES L. RICHEY
Timken Roller div. post

LOUIS J. PRIOR
National Supply traffic mgr.

WILLIAM T. HOFFMAN
National Supply traffic mgr.

Tube & Metal Products Co., Newport, Tenn.

Charles L. Richey was appointed general production manager, Bearing Rock & Bit Div., Timken Roller Bearing Co., Canton, Ohio. He was assistant general production manager.

Stuart F. Cooper was appointed sales manager for castings at Cooper Alloy Corp., Hillside, N. J. He was manager of advertising and sales promotion. Donald C. Huber was made director of sales promotion and market research.

Don C. Leith, formerly with Eastern Air Devices Inc., joined Price Electric Corp., Frederick, Md., as general sales manager.

Norman F. Garrett was elected vice president and general manager for manufacturing of Crane Co., Chicago. He will direct six plants. He was general manager, Chicago manufacturing division. Walter Kovalick was made assistant general manager-Chicago.

National Supply Co., Pittsburgh, appointed Louis J. Prior traffic manager, machinery division; William T. Hoffman, traffic manager, tubular division. They will divide responsibilities formerly held by John N. Lind as general traffic manager. Mr. Lind recently was named director of transportation for Armco Steel Corp., of which National Supply is a subsidiary.

Donald J. Leman was made manager of systems and procedures, Consolidated Electrodynamics Corp., Pasadena, Calif. He succeeds Edward P. Fleischer, recently named assistant to the president.

John C. Welch Jr. joined the West Coast sales staff of O. Hommel Co., Pittsburgh. He is primarily concerned with porcelain enamel frit sales.

R. H. Gehring was made sales manager-industrial products in the Painesville, Ohio, home office of Larco Inc. Former sales engineer, Pittsburgh territory, he is succeeded by R. B. Berkey.

Worcester Pressed Steel Co., Worcester, Mass., named Maynard F. Carter vice president. In addition to duties as secretary and comptroller, he assumes general plant supervision.

Donald L. Rousey was appointed chief engineer, Leslie Welding Co. Inc., Chicago. He was with Kritzer Radiant Coils Inc.

F. B. Wilkinson was elected president, Logansport Machine Co. Inc., Logansport, Ind. Former vice president, he succeeds Mrs. E. P. Wilkinson, now chairman.

Brig. Gen. Monro MacCloskey, USAF, ret., was made assistant to the president, Crosley Div., Avco Mfg. Corp., with offices in Washington.

International Resistance Co., Philadelphia, appointed Jack R. Isken chief, reliability and quality engineering.

George C. Hall succeeds Harry A. Pierce, retired, as manager of industrial distributor sales for Rollway Bearing Co. Inc., Syracuse, N. Y.

Skinner Chuck Co., electric valve division, New Britain, Conn., appointed William J. Bloudek sales manager; Anders Anderson, sales office manager.

OBITUARIES...

Howard C. Walters, 41, works manager, Cleveland mill division, Chase Brass & Copper Co., died Oct. 24.

George C. Kerr, 68, a buyer for the foundry of Worthington Corp., Buffalo, died Oct. 20.

Arthur E. Heimbach, president of General Railway Signal Co., Rochester, N. Y., died Oct. 17.

Edward B. Mullen, assistant manager, St. Louis Div., United States Steel Corp., died recently.

Frank W. Wabiszewski, 66, executive vice president, Maynard Electric Steel Casting Co., Milwaukee, died Oct. 18.

Robert J. Barker, 78, president and treasurer, Supreme Electric Products Corp., Rochester, N. Y., died Oct. 15.

DESIGNED WITH THE FUTURE IN MIND

Greenlee Transfer Machines can be Reworked to meet Product Changes

The Greenlee "Rearrangeable Unit" concept of transfer machine design is becoming increasingly popular in mass production manufacturing. These machines accommodate recurring changes in product design. Year after year they guard against costly obsolescence . . . they are changed to meet your changing requirements. Get the complete story from Greenlee.

Carborundum Builds

New buildings and equipment at Keasbey, N. J., plant will help meet gain in refractory use

CARBORUNDUM CO., Niagara Falls, N. Y., has launched a \$1-million expansion and modernization program at its Refractories Div. plant in Keasbey, N. J. Boyd M. Johnson, vice president, is general manager of the division.

New buildings will be erected; production facilities will be realigned; and new equipment will be installed.

New equipment will include a 225-ft long tunnel kiln, three tunnel dryers equipped with individual heating, air circulating, conveyor, and mechanical handling units. Other improvements will include new mixing machines and tamping equipment; waste-heat conservation units; and transformer units for additional power.

• **Program's Aim**—When materials are moved into a new mold and warehouse building, it will open the way for the realignment of equipment to improve the flow of manufacturing. Benefits will include increased productivity, more orderly flow of materials, and improved working conditions.

"Expansion of capacity is to keep pace with increased volume demand brought about by the anticipated rise in the economy," says Mr. Johnson. "Modernization, involving improved manufacturing techniques, is to satisfy the shape complexity, high tolerance, and quality control requirements brought about by broadening uses for the products."

Pusey & Jones Diversify

Pusey & Jones Corp., Wilmington, Del., has added metal fabrication to its operations as part of an extensive expansion and diversification program. Up to now, the firm has concentrated on shipbuilding and the manufacture of paper-making machinery.

Alcoa To Build Plant

Aluminum Co. of America, Pittsburgh, plans to build a facility to produce roller-coated aluminum

sheet in widths exceeding 60 in. The unit will adjoin the North Plant sheet mill at Alcoa, Tenn. Products will include aluminum alloy sheet and coils with baked enamel finishes.

Boosts Vacuum Melting

Latrobe Steel Co., Latrobe, Pa., is expanding its vacuum melting operations for the production of superalloy steels. Another consumable electrode vacuum melting furnace has been purchased from Lectromelt Furnace Div., McGraw-Edison Co., Pittsburgh. It will be housed in a new structure and is scheduled to be in operation early in 1959. Says Latrobe: "Needs of the jet and missile fields for steels of extraordinary purity indicate a stepup of our capacity to produce vacuum melted steels."

Foundry To Etch Castings

Chemical Contour Corp., Downey, Calif., has licensed Howard Foundry Co., Chicago, to use its processes and etchant compositions for chemical milling of castings. Initially, Howard will concentrate on thin-wall magnesium alloy and nodular iron castings. Eventually, all ferrous and nonferrous alloy castings will be processed. Chemical Contour has 51 different etchants for 62 different alloys. More etchants are being developed.

Rolled Alloys Expands

Rolled Alloys Inc., Detroit, has enlarged its steel service center by purchase of part of the Packard Motor Co. plant in that city. The firm is a distributor of Eastern Stainless Steel Corp. products and a leading marketer of heat and corrosion resistant alloys. Executive offices of Rolled Alloys will be at 5309 Concord, adjoining the 43,000 sq ft warehouse.

Forms Hydra-Blast Div.

Automation Services Inc., Detroit, formed a Hydra-Blast Mfg. Div. Products will include wet-blasting, custom-designed, automatic, and manual machines and process cycles; specially compounded wet-blasting abrasives and related supplies.

Operates Blooming Mill

Bethlehem Pacific Coast Steel Corp. has started operating its new 32-in. blooming mill at Seattle.

The mill is one of the major facilities included in a \$25-million expansion and modernization program at Seattle. It can reduce a 24-in. square ingot to a 4-in. square billet in 3 minutes. A new merchant bar mill is being constructed to process the billets.

The steel plant has increased the size of its ingots for rolling in the new blooming mill to 6½ tons each, six times their former weight.

Birdsboro Widens Line

Timken Roller Bearing Co., Canton, Ohio, purchased from Birdsboro Steel Foundry & Machine Co., Birdsboro, Pa., a mill for piercing alloy and stainless steel tubing. The complete mill with inlet and outlet tables is scheduled for delivery to Timken's Gambrinus Works in June, 1959.

G. Clymer Brooke, president of Birdsboro Steel, says this is the first piercing mill ever built by his company and represents the start of a complete line of seamless tube mill equipment, including piercers, plug mills, elongators, reelers, sizing mills, stretch reducing mills, mandrel mills, tube straighteners, hydrostatic tube testers, and related handling equipment. Birdsboro will also make a complete line of welded tube mill equipment.

Grants Etching License

Diversey Corp., Chicago, has granted a nonexclusive license to Chas. Pfizer & Co. Inc., Brooklyn, N. Y., covering its method of etching aluminum and aluminum base alloys. Diversey's use of gluconic acid derivatives with caustic soda solutions in aluminum etching operations led to the development of Aluminux which prevents sludging of aluminum oxide while producing a desirable finish.

Irwin Foundry Renamed

Irwin Foundry & Mine Car Co., Irwin, Pa., changed its name to Irwin-Sensenich Corp. The firm makes coal mine cars and related

mining accessories, industrial cars, heavy duty material handling rolling stock, and supporting equipment.

Thompson Regroups

Thompson Products Inc., Cleveland, has regrouped five of its manufacturing divisions to combine all of the company's automotive original equipment and replacement parts activities in the U. S. under Edward P. Riley, vice president who previously directed the Tapco group of divisions. Stanley C. Pace succeeds Mr. Riley as manager of that operation.

James H. Coolidge, vice president, was named chief fiscal officer of Thompson Ramo Wooldridge Inc. when Thompson Products' merger with Ramo-Wooldridge Corp. became effective Oct. 31.

Affected by the realignment are: Valve, light metals, and replacement divisions in Cleveland; Michigan Div., with operations in Cleveland and Warren, Ohio, Detroit and Portland, Mich.; and Ramsey Corp. (wholly owned subsidiary) with plants in Manchester and Sullivan, Mo.

Gets Swiss Gear License

Philadelphia Gear Corp., Philadelphia, has been appointed exclusive agent in the U. S. and territories for the manufacture of industrial gears designed by Maag Gear-Wheel Co. Ltd., Zurich, Switzerland.

Shifts Decatur Operations

One of the two plants of the Marvel-Schebler Products Div., Borg-Warner Corp., at Decatur, Ill., is being converted to the manufacture of air-conditioning and refrigeration equipment. Formerly known as the Transmission Dept., the plant has been renamed the Decatur Works of the York (Pa.) Div. The other Decatur plant will continue to operate as the Marvel-Schebler Products Div., making carburetion equipment and control rod mechanisms for nuclear reactors. S. S. Meadows is vice president of the York Div. and is general manager of the Decatur Works. A. B. Pulliam continues as vice president and general manager of Marvel-Schebler.

NEW ADDRESSES

John A. Roebling's Sons Corp., Trenton, N. J., moved its district offices and warehouse to 340 Roebling Rd., South San Francisco, Calif. The firm, a subsidiary of Colorado Fuel & Iron Corp., makes wire and cold rolled products, wire rope, electrical wire and cable, and fabricates bridges.

Allmetal Screw Products Inc., Garden City, N. Y., opened a new office and warehouse for its West Coast Div. at 5822 W. Washington Blvd., Culver City, Calif. A new office for its Midwest Div. was opened at 6424 W. Belmont Ave., Chicago 34, Ill.

Electric Storage Battery Co. moved its corporate general offices to 2 Penn Center Plaza at 15th Street and Pennsylvania Boulevard, Philadelphia, Pa. Headquarters of its Exide Industrial Div. were moved to the plant at Rising Sun and Adams Avenues, Philadelphia.

Colson Corp., maker of material handling equipment and institutional wheeled equipment, moved its executive sales offices to 7 S. Dearborn St., Chicago, Ill.

Mettler Co. Inc., a division of Eclipse Fuel Engineering Co., moved to 1101 Buchanan St., Rockford, Ill.

General Logistics Div., Aeroquip Corp., moved to a new office and factory building at 2929 Floyd St., Burbank, Calif. The division makes cargo tie-down and load control equipment.

NEW PLANTS

Jones & Laughlin Steel Warehouse Div., Jones & Laughlin Steel Corp., Pittsburgh, opened a service center at 6901 Preston Highway, Louisville, Ky. The facility includes more than 100,000 sq ft of floor area, says Ray Hale, Louisville warehouse manager.

James A. Coe Steel Co., Raritan, N. J., leased a building on Green Lane, Bristol, Pa. The firm is a

distributor of sheet, strip, coil, and plate steel.

CONSOLIDATIONS

Eclipse Fuel Engineering Co., Rockford, Ill., purchased Lookout Boiler & Mfg. Co., Chattanooga, Tenn., and will operate it as the Lookout Boiler Div. Everett Magnuson, vice president of Eclipse, will direct operations.

NEW OFFICES

Fuller Co., Catasauqua, Pa., established a district office at 280 Madison Ave., New York, N. Y., managed by Andrew van der Lyn. The firm is a subsidiary of General American Transportation Corp., Chicago.

ASSOCIATIONS

Thomas R. Hughes was elected president of the Service Tools Institute, New York. He is vice president and general manager of the Utica Drop Forge & Tool Div., Kelsey-Hayes Co., Utica, N. Y.

Tri-State Structural Steel Fabricators Association, Pittsburgh, elected these officers: President, David Zahniser, Levinson Steel Co., Pittsburgh; vice president, R. E. Prince, Ohio Valley Structural Steel Co., Newton Falls, Ohio; secretary, John Agey, Ingalls Iron Works, Verona, Pa.; and treasurer, John Cook, Keystone Fabricating Co., Pittsburgh.

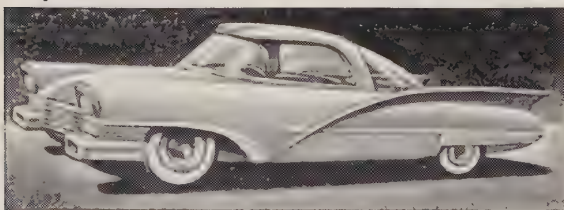

Miss Janet Weiner, treasurer of the National Association of Waste Material Dealers Inc., New York, will retire Jan. 1 after 35 years of service. She will be succeeded by M. J. Mighdoll, NAWMD administrator.

A committee will be formed to co-ordinate mechanical test methods used in international standardization of metals and metal products. It will be established by the International Organization for Standardization, Geneva, Switzerland, and designated ISO/Metesco.

forward with forgings. **75** years!

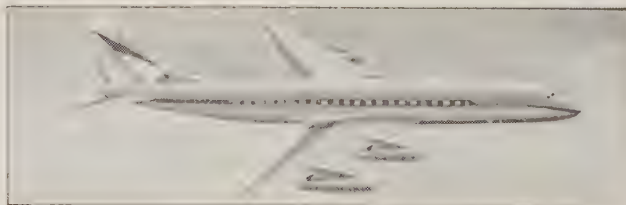

The steel plowshare was the basic agricultural tool when Wyman-Gordon was established seventy-five years ago. At that time, it took approximately 50 per cent of the nation's work force on farms to produce food for our country's needs.

With today's mechanical farm implements, it requires only 12½ per cent to feed our people. The development of modern farm implements, motor cars, trucks and tractors, railroad locomotives, and the "Mach era" aircraft and space vehicles, would have been impossible without forgings.

Whenever the ultimate is required in power, speed, endurance or reliability there is no substitute for a forging. Today, as for seventy-five years, Wyman-Gordon continues in the forefront in new forging developments.

WYMAN-GORDON COMPANY

ESTABLISHED 1883

FORGINGS OF ALUMINUM • MAGNESIUM • STEEL • TITANIUM

WORCESTER 1, MASSACHUSETTS
HARVEY, ILLINOIS • DETROIT, MICHIGAN

Technical Outlook

JET CUTTER—Want to cut a hole where you can't get a torch or drill? National Northern Corp., division of American Chemical & Potash Corp., West Hanover, Mass., has a handy device that works like a rocket engine. A carefully controlled solid propellant (which may contain abrasive particles) literally squirts a hole in metal. It can be put in a remote location and triggered electrically. Mounted in a suitable carriage, it could cut a large round opening much like a cutting torch zips through tanks to make hatch openings.

RED HOT ELECTRIC MOTOR—Jet aircraft, missiles, and rockets will get the benefits of a new Westinghouse motor that operates in temperatures of 1000° F and more. A special development for limited application, it uses silver windings, treated graphite bearings, and a kind of "hot rock" insulation made of inorganic materials.

TOUGH SHOTBLAST LINERS—A new chromium vanadium steel with unusually high percentages of carbon and vanadium is tough enough for shotblasting liners, says Latrobe Steel Co., Latrobe, Pa. Tests show that the alloy lasts four to ten times longer than materials normally used for this purpose.

WARM FORMING—Engineers at Lockheed Aircraft Co. report that when they tried to form a severe flange on AM 350 annealed tubes nearly every part cracked. Then they heated both the workpiece and the tool to 350° F (barely warm for a metalforming operation) and eliminated the problem. One theory: Severe forming was raising the temperature of the material to about 300° F; preheating of both workpiece and tool simply provided an even heat and precluded thermal shock.

OLD PROCESS HELPS BELL—An ancient technique called metal sputtering may lead to major advances in printed circuits for electronic equipment, says Bell Telephone Laboratories, New York. It has laid down films of tantalum

and titanium thin enough to act as resistors. Capacitors are made by oxidizing the first coating and coating that with a film of gold. Bell says it is one of the most convenient ways to make useful thin films from metals with high melting points. In addition, they adhere strongly and film thickness can be controlled within quite narrow tolerances.

WATER PAINTS GAIN—Battelle Memorial Institute, Columbus, Ohio, says this country's use of such protective coatings has doubled during the last decade. Although their future seems unlimited, the institute's Ernest R. Mueller lists these problems which must be solved: 1. Better adhesion of exterior types to all surfaces. 2. A formula for a glossy enamel. 3. A hard, mar-proof industrial enamel. 4. Improved water resistance. 5. Built-in rust inhibitors for iron and steel.

TOWARD BETTER PLATING—A new process, called Silva-Brite, is said to be a step forward in permanently hard, mirror finishes. Features include speed, plating solutions at room temperature, 100 per cent specular reflection from heavy to flash deposits which are hard (Brinell 135) and ductile. A simple treatment converts most plating solutions, says American Platinum & Silver Div., Englehard Industries Inc., Newark, N. J.

THIN SKIN WELDING—Engineers at Rohr Aircraft Co., Chula Vista, Calif., perfected a method for welding thin skin for aircraft parts. First they turn a carefully controlled lip on the edge of each skin where the joint is to be made. (The lip is turned 90 degrees to the foil plane.) These right-angle flanges are butted, clamped, and a backup bar is placed underneath to channel a helium atmosphere to the underside of the joint. A Heliarc welder passes down the top of the joint, melting the flange down. No filler material is added—the weld heat treats to parent metal properties, and the ductility of the parent metal is reduced only slightly at the weld joint. Aerodynamic smoothness is easily maintained, say Rohr engineers.

Furnace Slashes Annealing Costs in Half

How We Beat the Cost Crisis

THE JOB: Anneal Parts Between Drawing Operations

OLD METHOD

Wash
Transfer
Anneal

Pickle
Transfer
Relubricate

NEW METHOD

Wash
Transfer
Anneal
Relubricate

} **ELIMINATED**

LOADING AND UNLOADING on this line are manual operations—but they are the only ones. The rest, including annealing, relubricating, and transfer, are automatic

Continuous operation through annealing and relubrication of deep drawn parts has eliminated pickling and reduced material handling. The investment has a three-year payoff. This article is one of the top entries in the Cost Crisis Awards Competition. Another will be published next week

WHEN YOU set out to cut manufacturing costs, you often can reap benefits you hadn't counted on.

That's the way it worked at Worcester Pressed Steel Co., Worcester, Mass. What started out as a program to cut annealing costs also turned up solutions for handling, brazing, and part-quality problems.

At this job stamping company, parts of all sizes and configurations, including deep drawn pieces, are turned out for a long list of customers.

Secondary operations like machining, tapping, welding, washing, and painting often must be done.

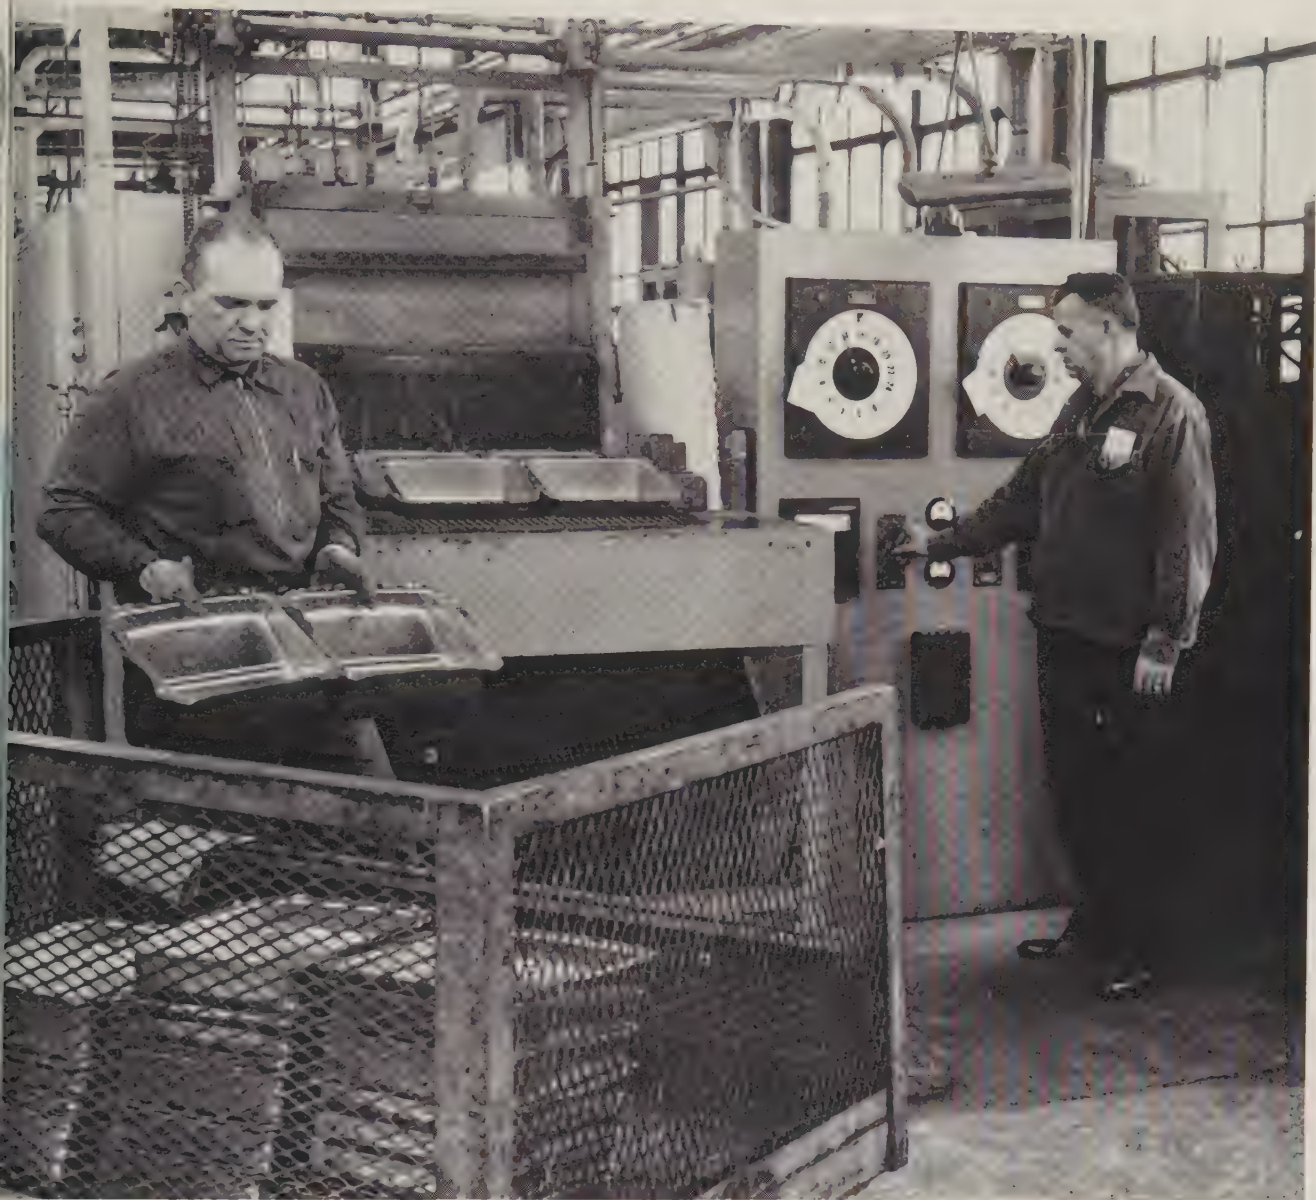

In the business of subcontracting, constant patrolling of all costs is a

must. Without it you have no vestige of competitive strength.

Production men at Worcester know this. In their over-all attention to costs, says Clarence G. Page, plant engineer, they took particular note of the expense of hardening and annealing.

• **How It Was**—Car bottom furnaces, pusher type furnaces with partially controlled atmosphere, and electric furnaces were used for heat treating. Much of the equipment was old.

Parts were washed to remove the drawing lubricants, then put through the annealing operations.

Next, pickling was necessary to remove scale. Finally, the parts were relubricated for successive operations.

The system took a lot of hauling of parts from washing, to annealing, to pickling, to lubrication.

- **And Now**—After analyzing their needs, and the equipment available to them, Worcester chose a continuous feed, atmospheric control furnace with a temperature limit of 2050° F. Built by C. I. Hayes Inc., Cranston, R. I., the furnace was designed with a door opening 12 ft high, and with a belt 30 ft wide to take care of the large drawn

parts frequently processed.

Taking advantage of the continuous annealing operation, engineers worked out a transfer to take the parts from the furnace, to the soap coating machine (for relubrication of parts), and then off the line.

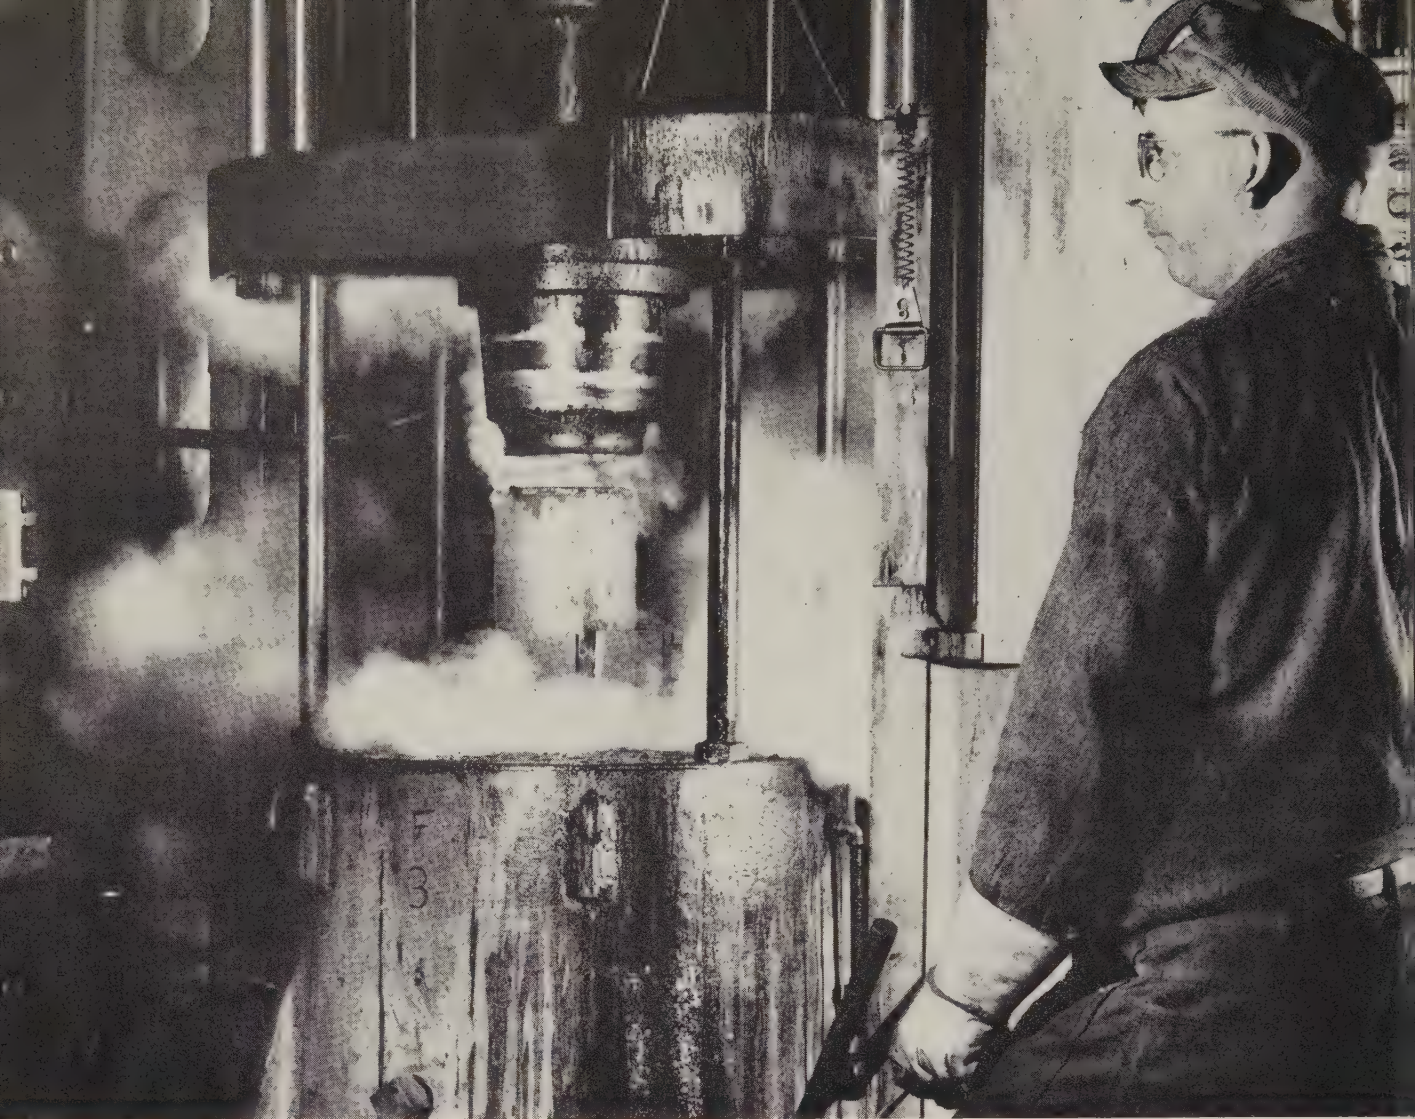

- **Savings**—Equipment and process revisions trimmed annealing costs by 50 per cent giving 1958 customers the advantage of costs at the 1951-52 level.

Closer control of the new atmosphere furnace eliminated pickling.

In addition: Higher, more closely controlled temperature makes the

furnace suitable for brazing—a job that used to require special equipment. Also, the new furnace can accommodate all the high alloy steels. Added floor space was made available when seven of the older furnaces were removed. With the added speed of the new furnace, much overtime and extra operations were eliminated. Closer control of annealing has led to better quality work, with a reduction in scrap.

- **Payoff**—Cost of the project came to about \$75,000. The investment should be recovered in less than three years.

The blank, sheared to length from a billet, is hot forged into a cup at 2150° F

Hot-Cold Forming Boosts Quality, Prunes Costs

These advantages are cited by shellmaker: Less starting material is needed; lower carbon steel can be used; tempering and quenching are eliminated; machining steps are reduced

COLD WORKING operations, used to augment hot forging, may help simplify your production sequence and reduce the number of secondary operations needed to get a finished product.

It's working that way at the Berwick, Pa., plant of American Car & Foundry Div., ACF Industries Inc. A combination hot cup, cold draw process is turning out 8-in. howitzer shells.

Herbert H. Rogge, president of the ACF division, describes the method as "a marriage of the finer points of forging and cold working that can provide industry with additional knowhow about the cold extrusion process, in addition to supplying the military with an improved ordnance product."

• **Plusses** — When compared with conventional processes for making shells this size (hot forging, then machining complete, relying on heat treating to get necessary mechanical properties), the combination method has these advantages, ACF reports:

1. Less starting material is required per piece.
2. Lower carbon steel can be used.
3. No quenching or tempering is required.
4. Less machining is needed.

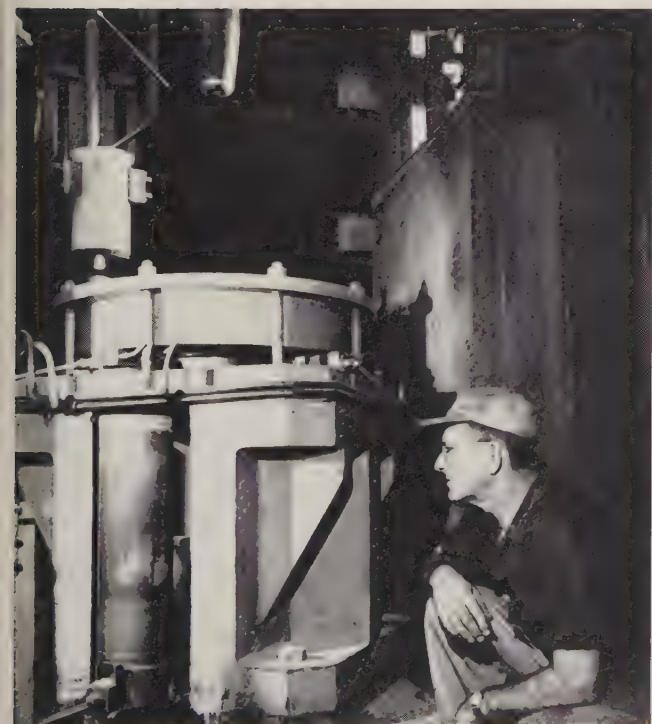

Also, quality of the finished shell is said to be superior. A unit weight spread of 18 ounces has been ob-

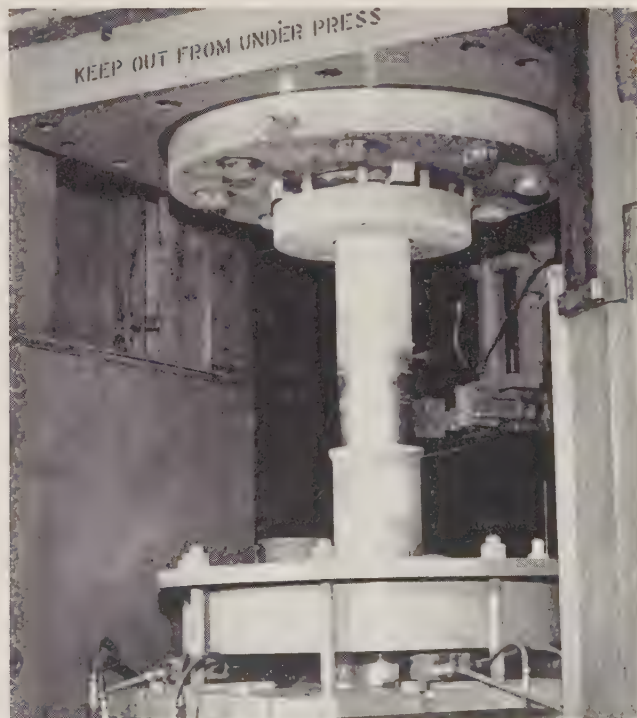

Rough machining faces the open end of the forging, removes any surface defects, and assures starting concentricity

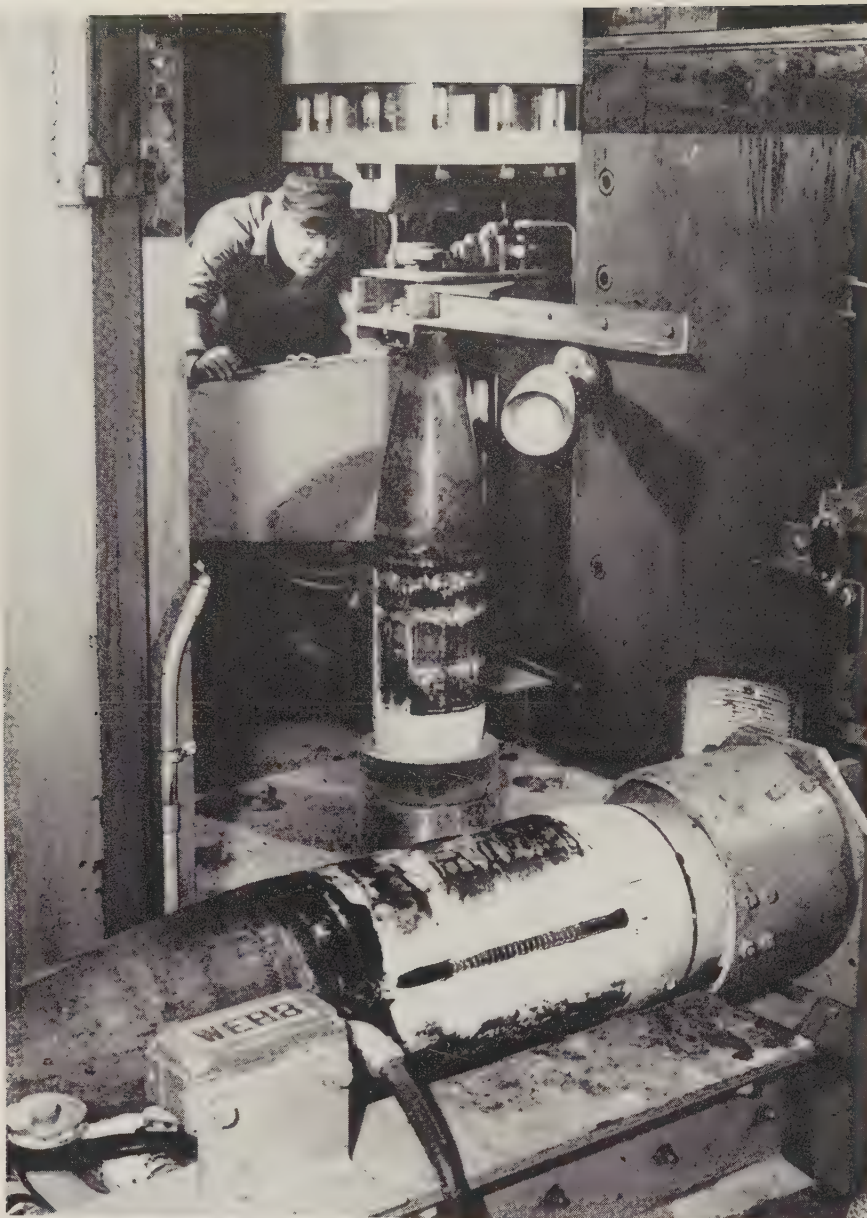

After phosphate coating, the machined cup is cold extruded (forward) in this press

After a second phosphate coating, the shell is cold coined

Here the coined piece is being cold drawn through a die

After a final phosphate coating, the shell goes through this one-step nosing operation that gives the nose the exact shape required by the military. The forming operations on the shell are complete

The finished shell has been machined, the rotating band added, the base plate welded, and the part is painted

tained with ACF shells, with a correspondingly consistent volume. The acceptable range permitted by specification is 4.8 lb. Shells now have a 40-microinch finish. Former allowance: 250 microinches.

- **Steel Saving**—Raw material used in the new method is a $7\frac{3}{8}$ -in. section of a round-cornered, square billet of semifinished steel, weighing 189 lb. The conventional method used a starting piece of the same cross section weighing 290 lb. This represents about 30 per cent saved in starting material.

- **Low-Carbon Steel**—The conventional method attains specified mechanical properties of yield, elonga-

tion, and reduction in area by heat treating a 0.55 to 0.65 per cent carbon steel. The ACF method produces the same mechanical requirements by cold working 0.20 per cent carbon steel.

- **Less Heat Treat**—Conventional shells must be heated to the austenitic range, oil quenched, then tempered prior to final machining. The new method uses two selective heat treatments, both induction. One follows forward extruding, prior to coining and drawing. The second follows drawing, prior to nosing. The cold nosed shell is stress relieved prior to finishing.

- **Less Machining**—Conventional

shells are rough and finish machined to final shape and size. At ACF, the configuration of the cold work dies determines the surface contour of the finished shell. The bulk of the material comes off while turning the hot forged cup, facing and chamfering the drawn piece, facing, boring, and tapping the nose, and preparing the rotating band groove. From 25 to 30 lb of metal is machined off, vs. 90 to 95 by conventional practice.

- **Efficiency**—The process lends itself to conveyORIZED handling. ACF reports that a shell can be made on the new line at a saving in man-hours of about 50 per cent.

Eight Rules for Simplified Drafting

- **Use words to eliminate drawings or projected views:**
Description is adequate for sleeve or threaded stud. Specify "hex, square, or round stock" instead of drawing another view.
- **Omit elaborate details:**
Use broken lines for outside or pitch diameters. Instead of drawing teeth or threads, use dotted lines or words. Eliminate arrowheads.
- **Use keyed legends for nuts, bolts, and other hardware:**
Show outline only when necessary for location.
- **Use dotted lines, cross sectioning only for clarity.**
- **Use symbols for hole sizes.**
- **Avoid hand lettering.**
- **Use datum lines.**
- **Make freehand drawings whenever possible.**

Drafting Made Easier

Simplified methods reduce manpower requirements. Side benefits include improved readability and reduction of production training time for new personnel

SIMPLIFIED drafting can save you up to 30 per cent in manpower, says American Machine & Foundry Co.

The firm discovered such savings after adopting the technique at its engineering service laboratory, Greenwich, Conn.

● **Made Analysis** — AMF started by thoroughly checking its drawing costs. Here's what it found: An average drawing took about 13 hours, or 4.5 hours per square foot; draftsmen spent about 75 per cent of their time on productive work.

"We were satisfied with the individual's work," says Jay H. Bergen, director of the laboratory. "We added to his efficiency by having

clerical people do his legwork, such as obtaining catalogs and prints. But the real scope of our savings became apparent after we took a closer look at the prints themselves." Here's what he found:

- 72 per cent of the drawings contained unnecessary information.
- 35 per cent could have been drawn on smaller paper.
- 36 per cent contained views that added nothing to the information displayed.
- 9 per cent could have been described with words instead of an illustration.

After adopting the simplified approach, AMF gained these benefits:

1. The morale of draftsmen has

shown marked improvement. 2. Planning and inspection departments report their people find far less need to contact engineering people for print clarifications. 3. Production managers say it's easier to train employees with simplified drawings. 4. Shopmen readily accept the new technique, and lose less time in reading and interpreting symbols.

● **Training**—Mr. Bergen has been running simplified drafting seminars for the National Metal Trades Association as part of a cost cutting program. Five simplified drafting classes are scheduled for this fall.

Authority Asks Co-operation

Too much publicity on simplified drafting could work against 14 years of effort to unify blueprint practices in the U. S., Great Britain, and Canada, maintains George Noble, standards department head, Dominion Engineering Works Ltd., Montreal, Canada. He is also vice president of the committee on engineering drawings, Canadian Standards Association.

● **Moment of Truth**—Many rugged individualists who advocate simplification are often at crosspurposes with those who favor unification of practices, says Mr. Noble.

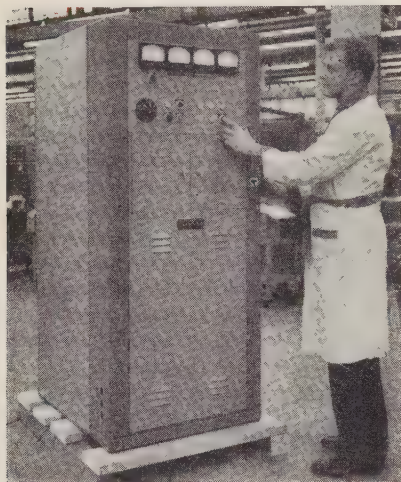

Simplified drafting, often publicized as a new concept, has been around for some time. As proof, Mr. Noble cites published national standards like American Standard Y14.1-1957 and the British Standard 308. Both include well-established methods and conventions for saving time in the drafting office.

Such procedures are constantly under review in all three countries. New ideas, including simplifications techniques, are evaluated by separate committees with a view to eventual incorporation when they receive wider acceptance by industry.

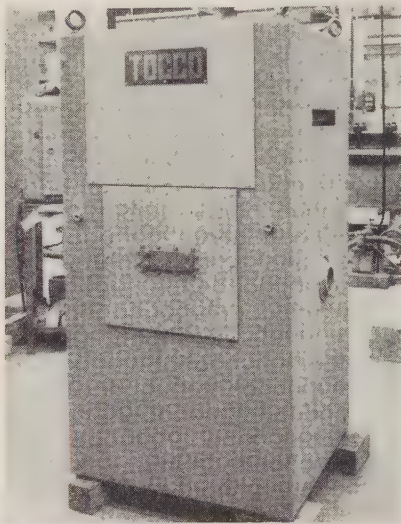

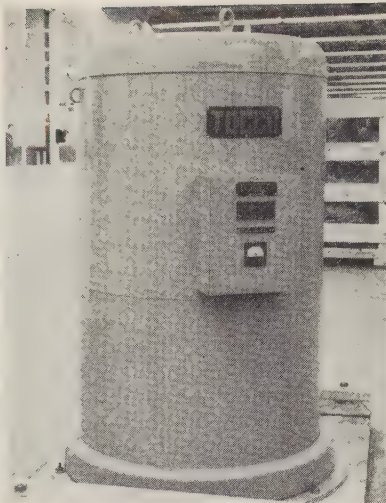

Publication of a unified practice is contingent upon general acceptance by all concerned, Mr. Noble holds. "Otherwise, we are faced with uncontrolled simplification which could run to extremes. We must contend with those who go overboard so completely for simplification they produce drawings which are unclear and do not contain essential information."

This enclosed generator . . .

A remote control panel . . .

And this work station . . .

Boost Heat Treat Flexibility

Line of induction heating equipment divides three major components into separate "building block" units. It also means less space is needed on the production line

BUILDING BLOCK ideas started with special-purpose machine tools, but they are turning up in countless other types of equipment as manufacturers look for ways to save their customers' money.

Latest to adapt the concept to its equipment is Ohio Crankshaft

Co., Cleveland. In a complete re-engineering of the Tocco line of induction heat treating equipment, the company has built system components as integral units.

• **Breakdown** — In the previous system, the generator was separate and remote (at least for big sys-

tems) but the control and the work station were incorporated in one relatively large unit. This meant considerable space had to be provided on the production line.

More important, it meant that when a user was ready to take out one special unit and add another, he frequently had to part with the whole machine, including control and work station.

• **Independent**—Now, the system is broken down into its three logical elements: Generator, control system, and work station. Only the work station needs to be on the production line. Both the generator and the control panel can be set against a wall or in a remote area out of the way.

More important, if the work station becomes obsolete for the job, another can be installed using the same generator and control, provided that the new work is within the capacity range of the power supply.

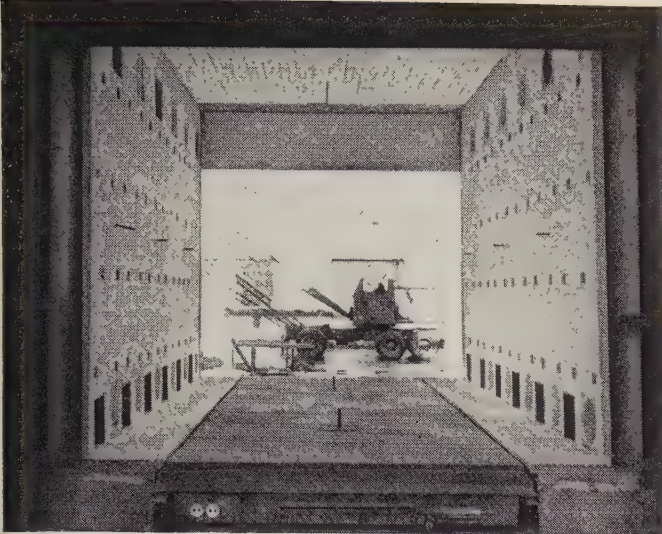

• **Generators**—The new generators have 7½, 15, or 30 kw at 10 kc, or you can get a 30-kw generator with a 3-kc range. The large ones are offered in 50 through 350 kw and they include 10, 3, or 1 kc ranges.

On large generators, if a critical part overheats, a thermally operated circuit breaker halts the operation. It remains open until a maintenance man recloses it. A series of such circuit breakers take the place of signals that light up to warn of overheating, go out when the cycle is stopped. By noticing which relay has tripped, the maintenance man knows which part overheated, simplifying troubleshooting.

• **Controls** — One control circuit can be set up to govern one or more work stations. The control panel's top and side panels can be removed to give added access for adjustments.

On small series, the generator can be mounted behind the panel. Panel and generator can be in a single enclosure, or mounted separately.

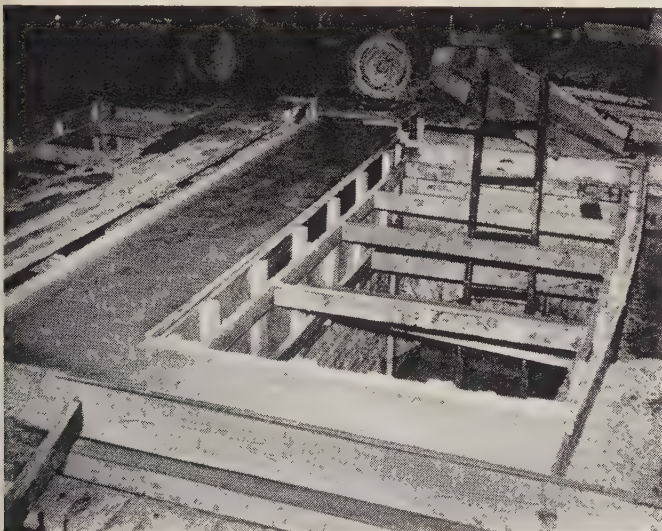

• **Work Stations** — Top and rear cabinet panels on the work stations can be removed to provide adjustment access. Since the control section is separate, work stations are smaller, take less room on the production floor.

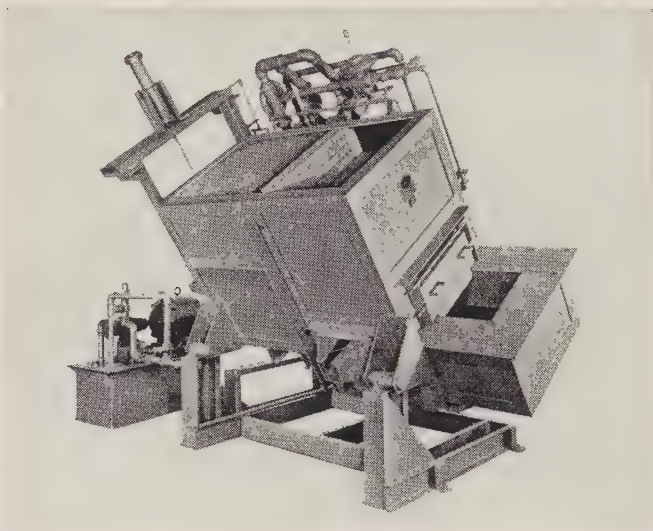

In this stress-relieving furnace, B&W Kaocrete-D is used on the floor ledges, car top, in the door jamb and at the end of the flat roof where it withstands the abrasion of the door. This material is specially designed to withstand severe abrasive conditions and mechanical abuse.

Heavy duty car top service requires a high strength castable. B&W Kaocrete-D is excellently suited for this service at temperatures to 2500 F. B&W Kaocrete-32 is recommended for service above this range.

B&W Kaocrete-32 has been cast to form the curb walls of a soaking pit. When mechanical abuse from ingots damages the curb, Kaocrete-32 has the necessary properties to localize the damage, thus maintaining the serviceability of the rest of the curb.

The castable lining of this aluminum reverberatory furnace must have unusually high strength to withstand the considerable physical abuse of charging, operating and cleaning, while resisting the penetration of the molten metal. Kaocrete-D is widely used in this application.

How B&W refractory castables solve

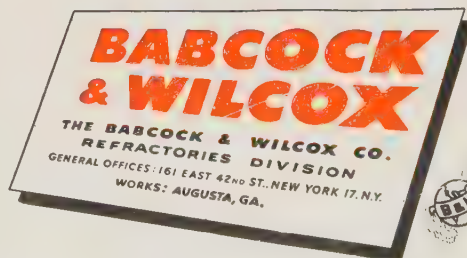

abrasion problems

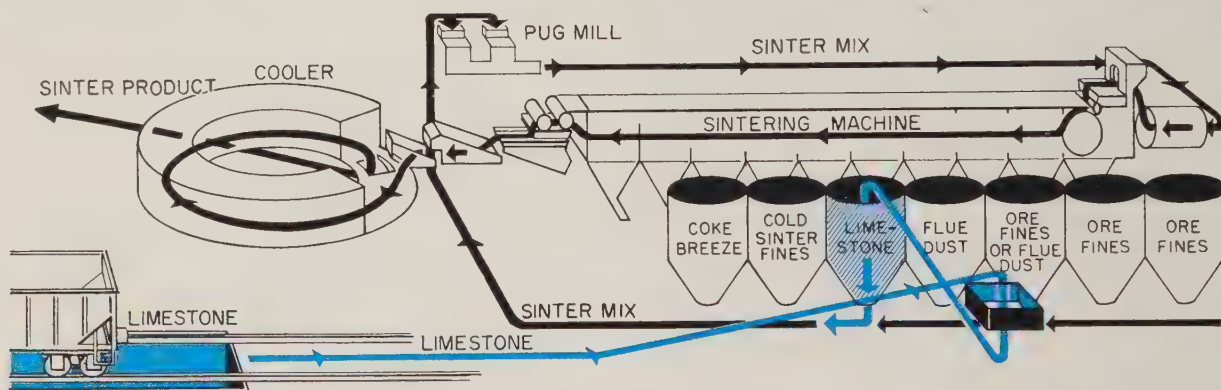

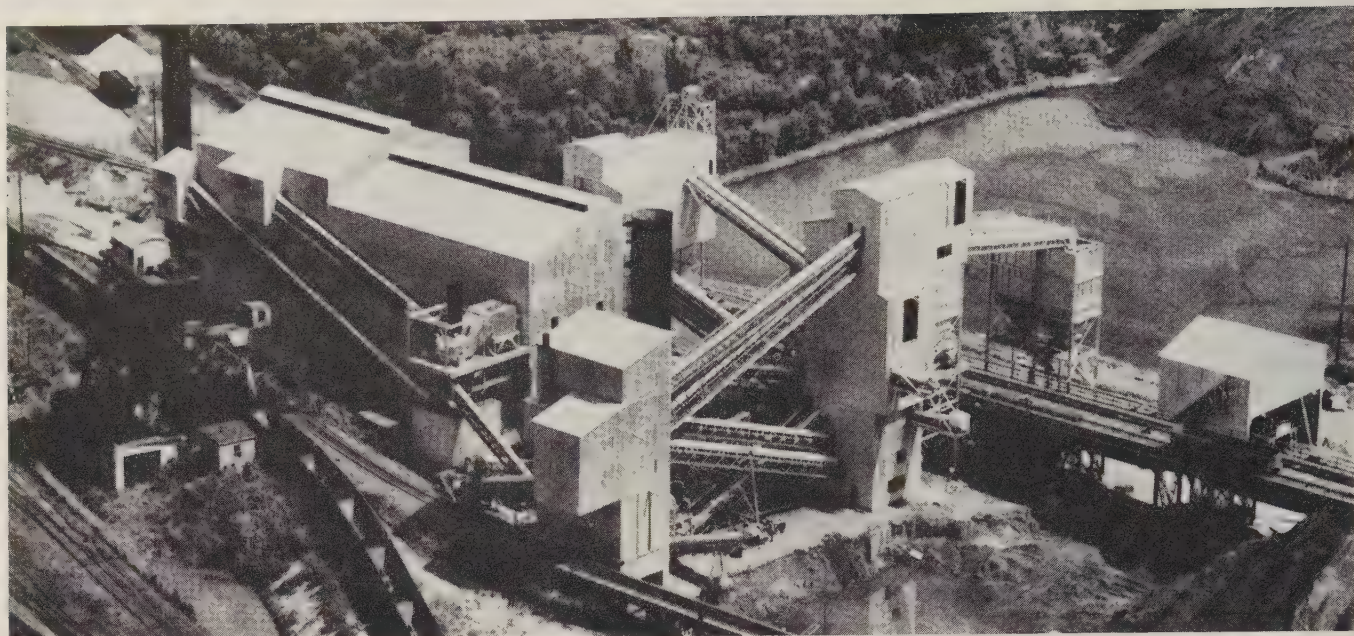

Refractory castable linings used in metal-working furnaces are often subjected to severe mechanical abuse. Scraping by hand tools, loading and unloading, and the action of the molten metal and particle-laden gases all affect the life of refractories. Among B&W's line of refractory castables are two that are particularly suited to withstand unusual abrasive conditions. They are B&W Kaocrete-D and B&W Kaocrete-32, both of which have been used successfully in many demanding applications.

B&W REFRACTORIES PRODUCTS: B&W Allmul Firebrick • B&W 80 Firebrick
B&W Junior Firebrick • B&W Insulating Firebrick • B&W Refractory Castables, Plastics and Mortars
B&W Silicon Carbide • B&W Ramming Mixes • B&W Kaowool

Send for a copy of B&W Bulletin R-35A. It gives additional information on versatile B&W refractory castables.

R606

Colored areas show where equipment handles limestone to make sinter self-fluxing. Such a setup is used in a sinter plant (top) built at Ashland, Ky., by Dravo Corp., Pittsburgh, for Armco Steel Corp.

Self-Fluxing Sinter: Boon for Equipment

Needed are machines to unload, convey, and store fine limestone at steel company sinter plants; and crushing, screening, grinding, and drying equipment at quarries

SELF-FLUXING SINTER has captured the imagination of two important segments of the metalworking industry.

To steelmakers, it holds the promise of lowering iron costs. (Iron production is increased; coke

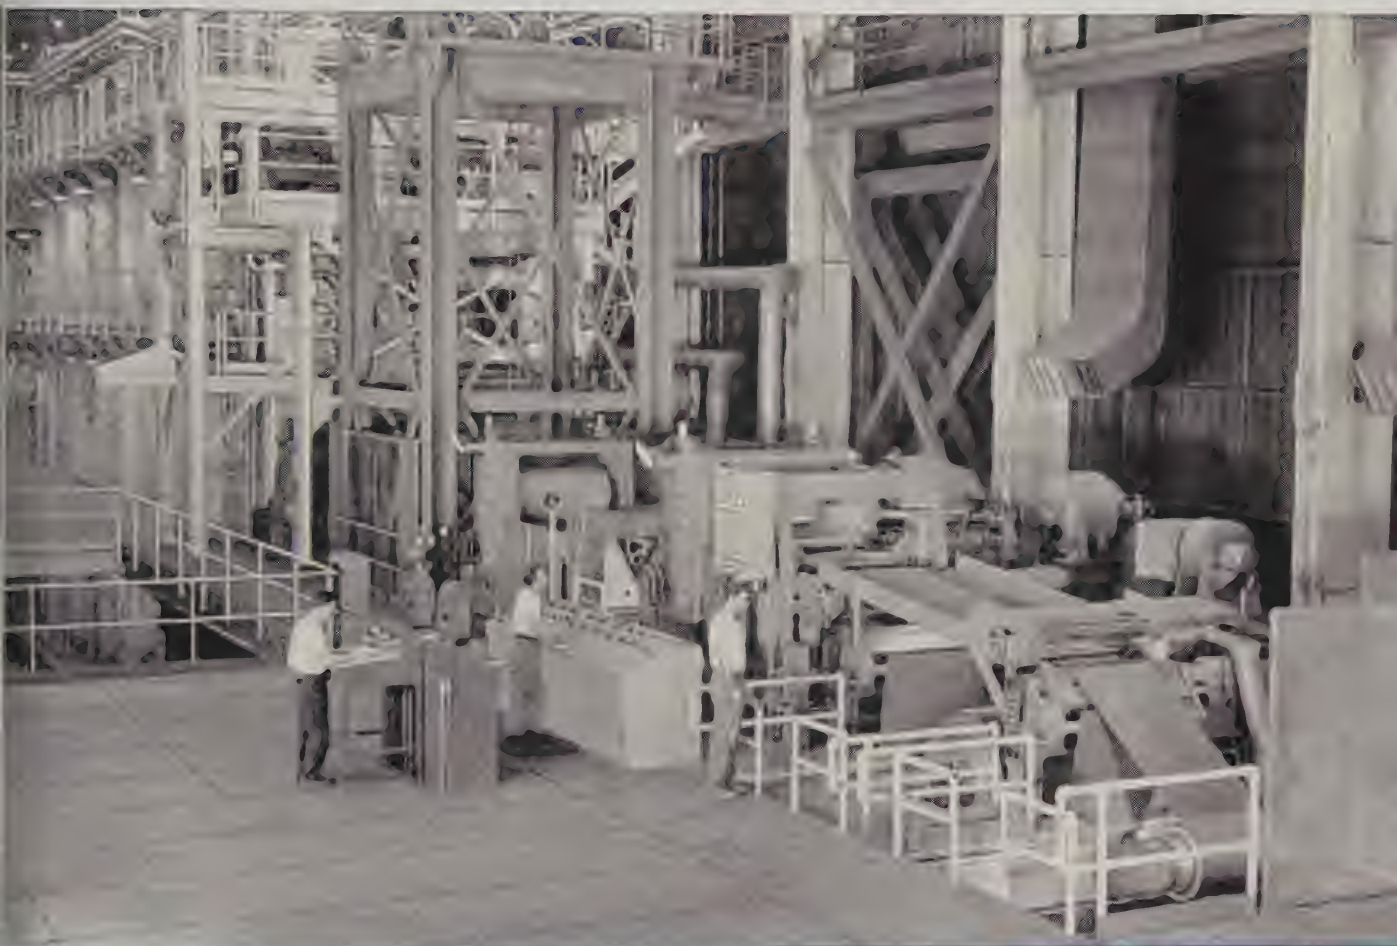

consumption is reduced.)

To makers of mill equipment, it means the generation of new markets through a change in technology. (By 1960, the annual sintering capacity in the U. S. will be at least 60 million tons.)

• **What It Is**—Sinter (a manmade feed for blast furnaces) is made self-fluxing by adding limestone fines to raw materials that go into the mixture. The finely ground material ($\frac{1}{8}$ in. or less in diameter, vs. the 2 to 5 in. chunks conventionally used in blast furnaces) becomes an integral part of the sinter. From 8 to 15 per cent limestone is usually needed to make sinter self-fluxing. The exact amount is governed by the type of ore used.

• **Impact So Far** — Every major

CLEANING AND ANNEALING LINES

MESTA 2000 FPM Continuous Cleaning and Annealing Line for Steel Strip in Tin Plate Gauges with Pay-Off Reels, Mash Welder and Tension Reels in Operation at Weirton Steel Company, Division of National Steel Corporation.

Designers and Builders of Complete Steel Plants

MESTA MACHINE COMPANY
PITTSBURGH, PENNSYLVANIA

steel producer with blast furnaces to feed is either using some self-fluxing sinter or is considering the move.

Equipment people are already cashing in on the sales potential of the new technique. Almost all the major steel producers have new sintering plants or are building them.

The switch to self-fluxing sinter creates a need for equipment to unload, convey, and store fine limestone at steel company sinter plants. Stone quarries need crushing, screening, grinding, and drying equipment. (Drying equipment is used in winter to lower the moisture content of the limestone to prevent it from freezing.)

Most of the sinter plants under construction and those recently completed have equipment to handle the fine limestone, and in most cases, it can be added to present sinter plants—one company, for example, is spending \$600,000 for storage and handling equipment.

• **How Weirton Does It**—One of the newest lines to incorporate equipment to make self-fluxing sinter is at the No. 2 sinter plant of National Steel Corp.'s Weirton Steel Co., Weirton, W. Va. One track hopper is used exclusively to unload crushed limestone from railroad hopper cars. It is equipped with a car haul, car shakeout, four-car thaw area, and a double cone bin (capacity, 85 tons). Each cone on the limestone hopper feeds a 60 cu-ft skip bucket which dumps into a 400-ton concrete silo. It has a 70 degree steel cone wrapped with steam coils for all-weather operation.

A vibrating feeder under the silo feeds two short belts that join the limestone system with the main miscellaneous material system. At the junction point of the two systems, transfer from one to the other will normally be done by chute arrangement, although an impactor is located there for use during extremely cold weather to break frozen lumps of limestone fines.

• **Quarries Get Ready**—Every major supplier of flux stone to the iron and steel industry is either prepared to supply the finely ground limestone or is studying needs for it. An Ohio firm, for example, has installed machinery to fine grind and size limestone and facilities to dry it at its quarry.

Equipping a quarry can cost \$500,000 or more, depending on the size of the quarry operation and the extent to which it goes into the production of limestone for sinter.

It is preferable to ship the material in covered hopper cars or trucks so that it can be protected from weather and moisture—although open hoppers can be utilized.

• **Role of Limestone**—Sinter is self-fluxing when it contains enough limestone to counteract the acids in the sinter's principal raw material, iron ore. If limestone isn't added to sinter as it is being mixed, it has to be added to the blast furnace.

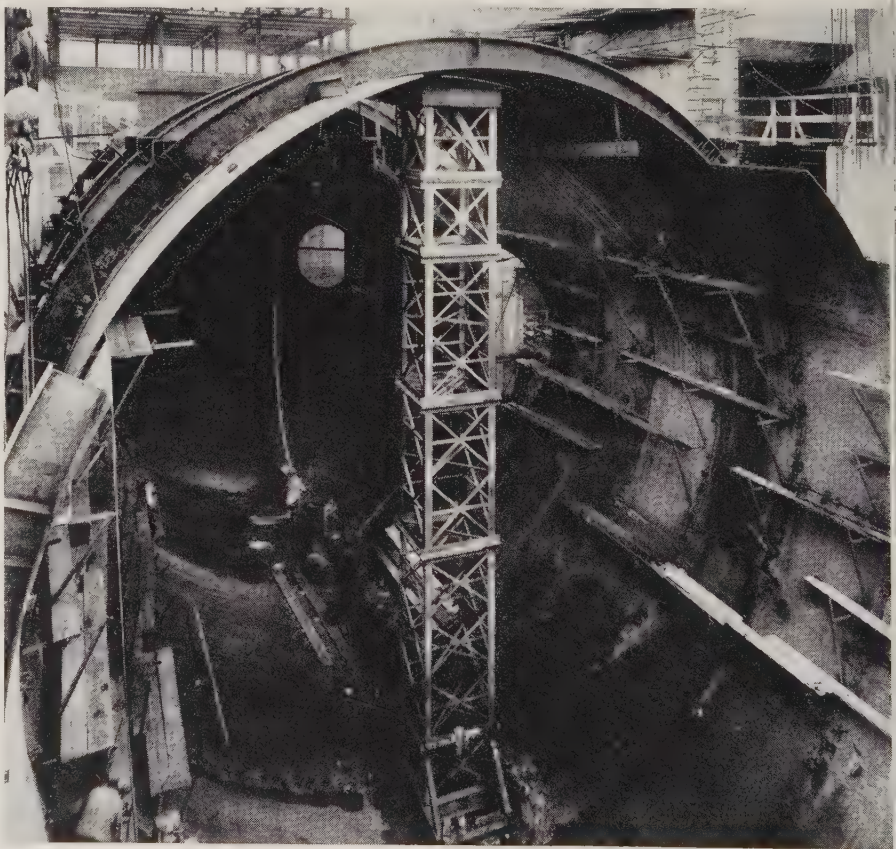

Before limestone can become effective, it must be heated to convert its calcium carbonate (CaCO_3) content into calcium oxide (CaO) and drive off carbon dioxide (CO_2). Use of the blast furnace to do this requires blast furnace coke, a high quality fuel. By achieving the calcination on a sinter line, coke

breeze, a less costly fuel, is used.

• **International Interest**—Other countries have been working with self-fluxing sinter. Russian practice, for example, was investigated this summer when a 19-man delegation of American steelmen (including STEEL's editor-in-chief, Irwin H. Such) visited that country.

J. S. McMahan, superintendent of blast furnaces, Steel Co. of Canada Ltd., Hamilton, Ont., is an authority on the subject. His experiments, in early 1956, were made with dolomite, rather than limestone. He used dolomite because it was readily available.

Mr. McMahan used dolomite fines of minus $\frac{1}{8}$ in. He found that sinter mixture which was 18 per cent dolomite fines was self-fluxing. The mixture increased iron output by 8.5 per cent and reduced coke consumption by 6.5 per cent. Furnace performance was satisfactory. The number of offgrade casts and variations of iron analysis were reduced substantially.

THIS AUXILIARY BOILER CONTAINER at the Shippingport (Pa.) atomic power station will be used to transfer heat from an atomic reactor. Built by Pittsburgh-Des Moines Steel Co., Pittsburgh, the all-welded tank is 147 ft long, 50 ft wide, and has walls $1\frac{1}{4}$ in. thick. Welds are made with $\frac{3}{16}$ -in., Lincoln Fleetweld 5 electrodes

Stanscrew service helps insure quality for new Tuthill pump

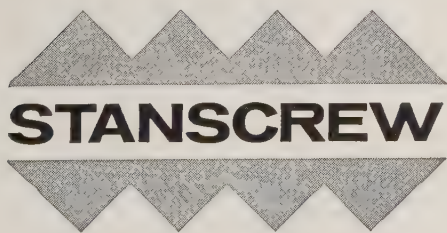

Marvin Williams, Works Manager, Tuthill Pump Company, says: "Dependable, precision-built fasteners are an essential ingredient of the quality we build into Tuthill Pumps.

"Therefore, when we designed our new series of high pressure Powermax pumps, we had our distributor arrange for a visit from Stanscrew's fastener specialist. The socket head cap screws he recommended for this demanding application met the stringent standards we have established. And because of our years of experience with Stanscrew, we know we can count on precise product uniformity and fast service."

Hundreds of other leading companies in

American industry have also learned that it pays to standardize on Stanscrew. For Stanscrew offers a comprehensive line of over 4,000 different types and sizes of standard fasteners . . . including a complete selection of socket, set, and cap screws. These are produced in three modern plants by fastener specialists with over 85 years of specialized experience. All 4,000 items are always in stock . . . quickly available.

When you have a fastener problem, call your Stanscrew distributor. He will arrange for a prompt visit from the Stanscrew fastener specialist. The specific recommendations he will make can often mean important savings.

Winding machine production rates are increased by the pails' capacity

Pails Cut Handling Costs

Using them for wire has reduced expenses in production of electric motors. Most important factor: They hold ten times more than conventional spools

BY USING magnet wire in special steel pails instead of spools, Fasco Industries Inc., Rochester, N. Y., has cut thousands of dollars from its annual manufacturing costs. (The wire goes into field windings for fractional horsepower motors.) Estimated annual savings in wire handling costs: \$15,000 to \$20,000.

The advance was made possible by the development of filling meth-

ods and of accessory equipment for removing the wire at high speeds—without damage or entanglement.

The most important feature: The pail holds ten times more wire (100 lb of 25 to 31 gage) than a spool. Two advantages result:

1. Pails are replaced only one-tenth as often as spools, saving on handling and machine and operator downtime.

2. Stator rejects are reduced more than 90 per cent. When wire runs out during the winding of a stator it is rejected. Normally, when one supply runs out (up to six are used) all are replaced to keep run-outs together.

• **Other Benefits**—The discardable Jal-Pak pails were developed by Jones & Laughlin Steel Corp.'s Container Div., New York. The elimination of handling returnable spools saves Fasco \$1500 to \$2500 annually in bookkeeping costs.

Wire is removed from the pails at speeds up to 2700 fpm in the manufacture of skeins for multiple speed motors. For small fractional horsepower motors, the speed is 300 to 450 fpm.

One-Step Reduction Process Developed To Trim Costs

THE electrothermal process for single-step reduction of metallic oxides promises relatively low cost production of metals and alloys which are now available only at high cost.

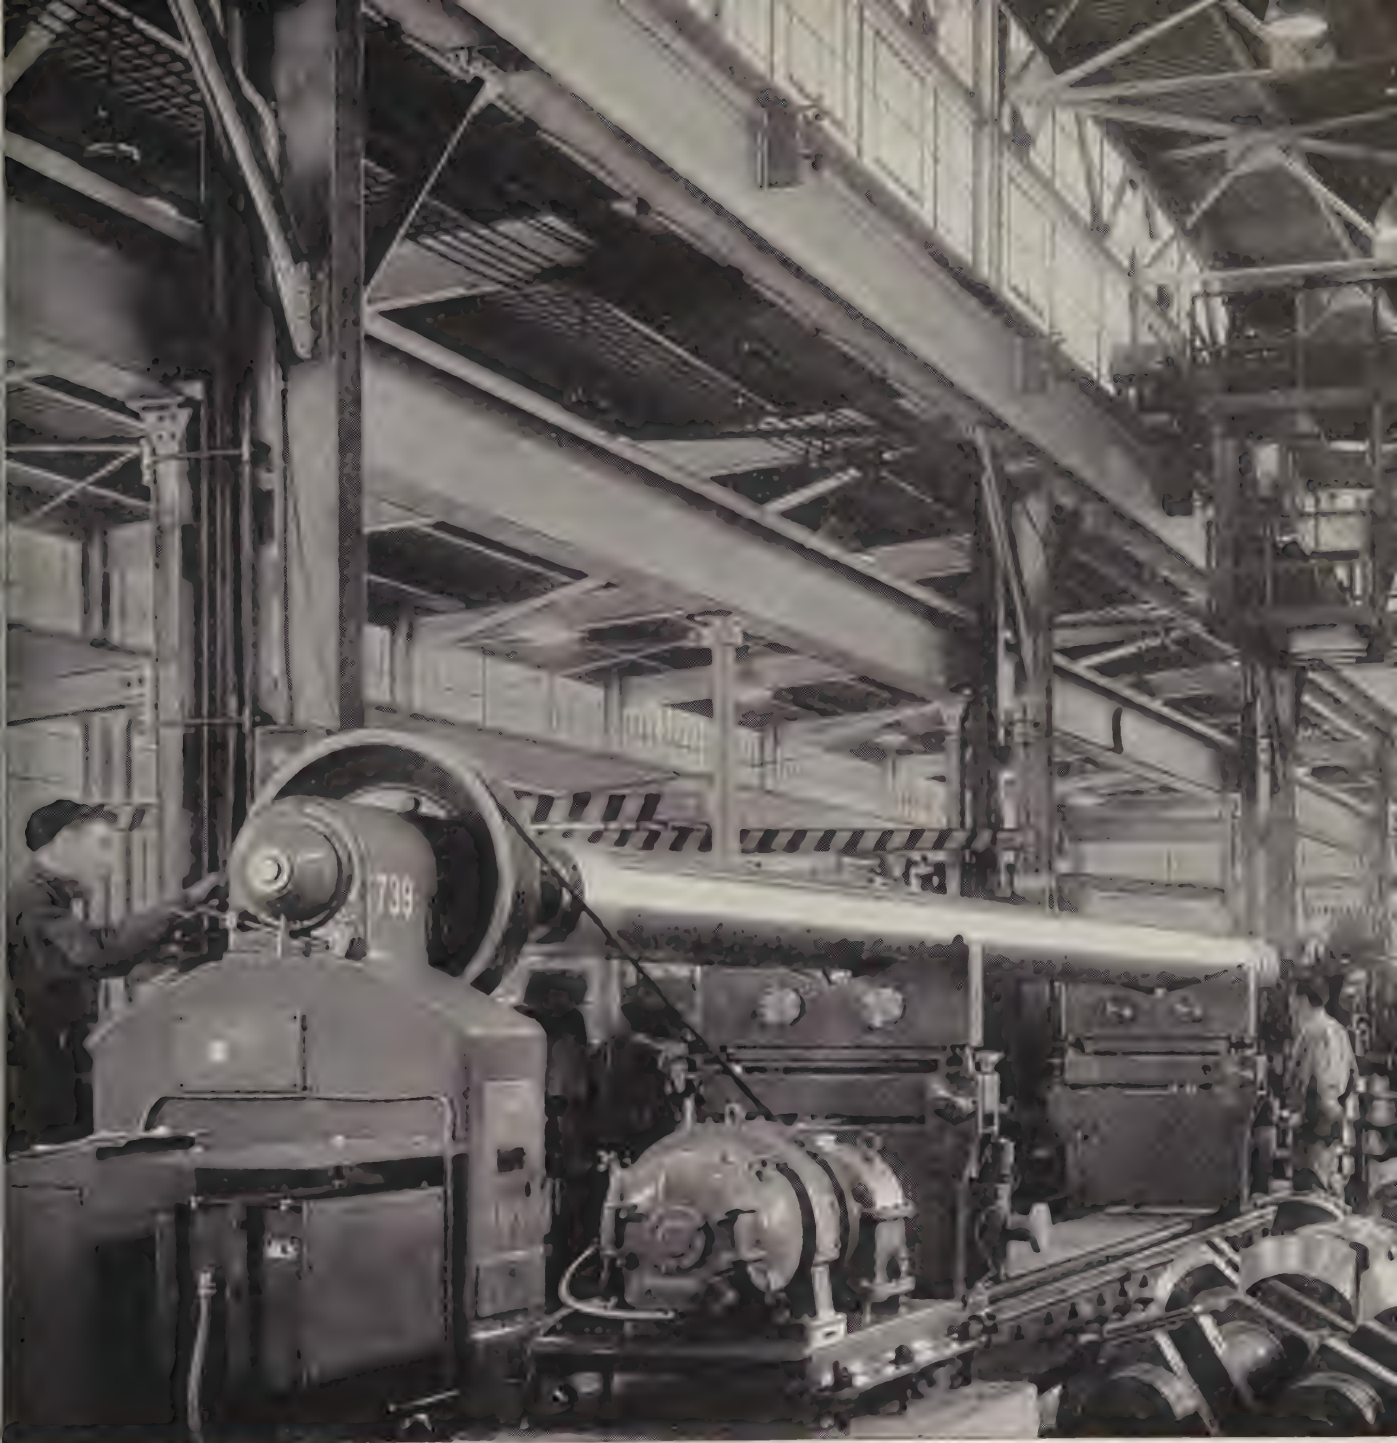

It is applicable to such metals as columbium, tantalum, boron, tungsten, vanadium, and titanium.

Work on the process will be done by Hydrometals Inc. (formerly Illinois Zinc Co.), New York, which has acquired licensing rights from Electro-Thermal Industries Inc., developers of the process.

• **How It Works**—Materials to be processed are placed in a closed chamber and subjected to temperatures as high as 5000° F and pressures up to 1 million psi. A low voltage electrical charge sets off an intense electrothermal reaction which results in an almost instantaneous reduction of ores to the metallic state, or direct synthesis of combined elements.

A significant feature of the process is its low unit cost. Since the key equipment is readily available hydraulic presses, tooling and setup is relatively simple and initial capital investment is at a minimum.

• **Will License**—Hydrometals' two-phase marketing plan calls for granting of sublicenses for use of the process, and for establishing its own facilities to make certain selected metals and alloys.

WHO FORGES THE TOUGH ONES? and dynamic balances them, too?

To further National Forge's reputation for producing precise forgings, we've installed one of the largest, most accurate dynamic balancing machines in use. Our American-Trebel has a 33,000-pound, 60-foot capacity.

Pictured on the machine is a 42 ft. propeller shaft that has been forged, machined, and hollow bored—all operations done in our National Forge plant. NFO specialists are shown balancing this 15,500 lb. shaft to within 730 ounce-inches in two planes.

If you want one responsible source to produce and control the quality of your forgings . . . from melting and forging the steel through machining and dynamic balancing . . . call National Forge. Let us quote on your next job—and *prove* "who forges and dynamic balances the tough ones . . . best!"

COMPANY

IRVINE, WARREN COUNTY, PA

Suction fan draws oxide gas away from operator forging hot molybdenum into rings at Steel Improvement & Forge Co., Cleveland

How To Forge Molybdenum

The exceptional high temperature strength of the metal makes it a valuable aircraft and missile material. With a few exceptions, it can be forged like steel

A CLOUD of vapor shrouds the part. The operator can't see the work. Any vapor that touches his skin causes irritation. It contaminates the equipment.

That's one of the difficulties of forging molybdenum. It is being solved along with the problems of controlled plastic flow at Steel Improvement & Forge Co., Cleveland.

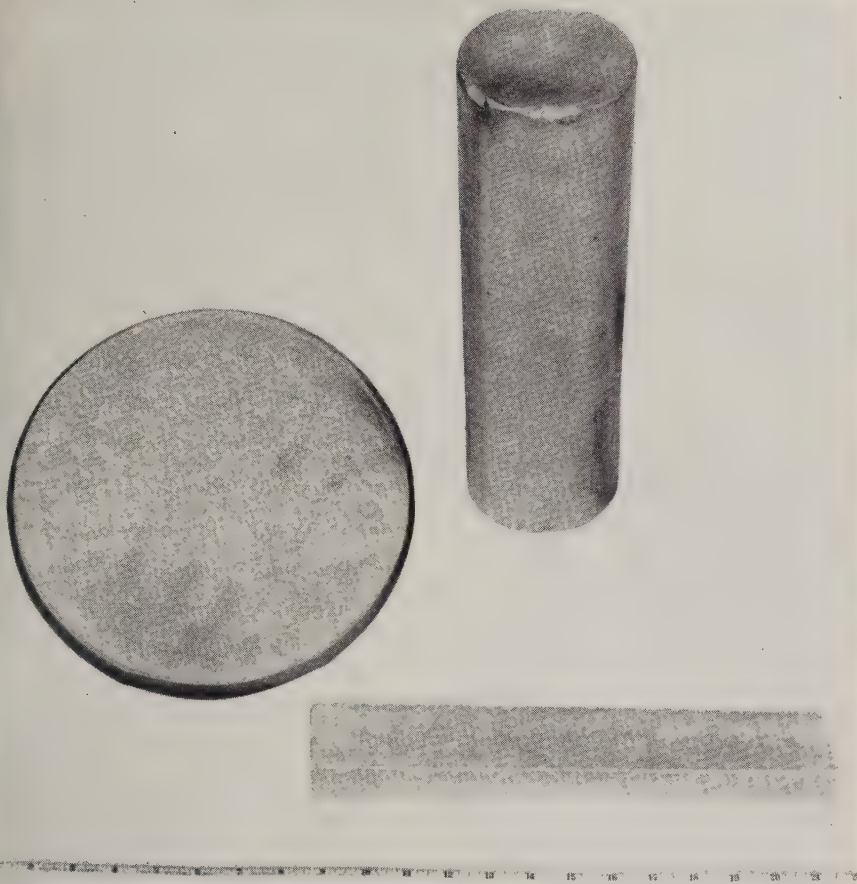

- **First Problem**—High impact velocities are needed to begin plastic flow. Once it is started, the metal must be kept moving. Sharp, light, interrupted blows will result in cold work stressing of the surface and cause cracking.

Fundamentally, the metal is satisfactory as a forging material. It exhibits flow tendencies similar to

steel (it will flow sideways and fill bosses and cavities). Remedies are largely a matter of technique.

- **Second Problem** — Oxidation causes a lot of trouble. Molybdenum trioxide powder builds up on clothing and the exposed portions of the body. It clogs the nasal passages, inducing coughing and burning. Also the coating deposits on tool surfaces, making them slippery.

A simple solution is to use a high speed suction fan which exhausts the cloud. A second meth-

Sintered molybdenum is a recent development. At top right is sintered forging billet; at left and lower right are a pancake and bar that have been forged from a sintered billet

od used at Steel Improvement & Forge: Protective coatings on the billet material. The process holds critical dimensional tolerances, producing forgings which demand positive control of metal movement and volume.

• **Harms Furnace Operation**—The mischievous cloud hampers control of the furnace temperature and creates problems in later operations. Most high temperature forging furnaces operate with radiomatic-type controls or platinum-rhodium couples. A buildup of molybdenum trioxide insulates these measuring devices, causing the furnace to overheat.

Control is assured by holding a reducing atmosphere in the furnace and by regular checks with an optical pyrometer during the processing cycle.

After long runs of molybdenum, the furnaces become saturated with the trioxide, causing oxidation of

products processed later.

• **Experience Shows Trend** — In general, contaminated furnaces have the following effects:

1. Violent oxidation with alloys that contain over 3 per cent molybdenum. Example: Forgings of

16-25-6 (6 per cent Mo) exhibit severe spalling and oxidation.

2. Rapid oxidation with most 300 and 400 series stainless, 4130, and Hastelloy C.

3. Slight oxidation increase with high chromium, high nickel alloys. The chrome and nickel act as natural inhibitors.

4. No noticeable oxidation increase with molybdenum-free metals (such as Inconel X).

The rate of attack on susceptible materials as a result of molybdenum contamination is pronounced in controlled atmosphere furnaces where there is relatively low circulation; and under reducing atmosphere conditions, freak results showing carburization with catastrophic oxidation may occur. Little difficulty is experienced with large forging furnaces which are generally open at one end and have excellent circulation.

• **A Challenge**—Lack of sensitive testing equipment is an impediment to the development of adequate methods for processing molybdenum. Ultrasonic contact scan methods are not suitable and conventional immersion sonic inspection equipment can detect only gross defects. Normal direct beam entrance is blanked out so that more than 50 per cent back reflection is seldom obtained.

New techniques developed by the General Inspection Laboratories of Bell, Calif. (with the help of Aerojet-General Corp. and Climax Molybdenum Corp.) have shown some promise. The method uses both the shear wave and longitudinal wave techniques.

The apparatus has a 3/4 in. lithi-

What Molybdenum Offers

High melting point: 4730° F.

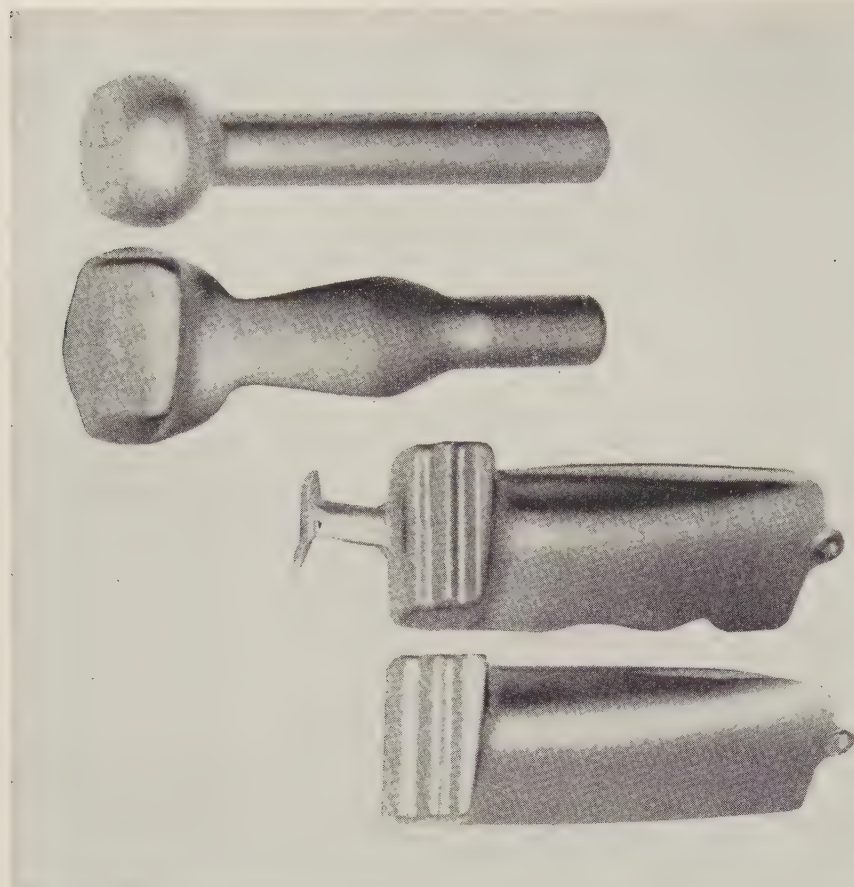

High modulus of elasticity: 80° F— 45.5×10^6 , 1500° F— 40.0×10^6 , 2500° F— 35.0×10^6 .

High creep and rupture stress, especially at high temperatures (over 1600° F).

High tensile strength at high temperatures: Rated better than any other high temperature material available in production quantities.

Insensitive to thermal shock: It's the result of a combination of high thermal conductivity, low specific heat, and low expansivity.

High resistance to abrasive erosion by hot gases when coated.

Steps in forging a molybdenum turbine bucket. Top to bottom: Upsetting, busting, blocking, and finish forging

um sulfate crystal of 5 megacycles frequency. The operating frequency for this crystal is 2.25 megacycles for both longitudinal and shear wave testing. While procedures have not been perfected, they have located known defects which normal methods could not detect.

Other methods of quality control are being investigated. These include ultraviolet particle inspection (zyglo testing) for finding tight ruptures and porosity, and x-ray techniques (which are effective up to 1-in. penetration).

• **Applications**—Two proved uses for arc-cast molybdenum forgings are missile components (particularly in the heat affected end of the guidance section) and turbine buckets and wheels for jet engines. Special coatings give the parts oxidation resistance.

In the first nine months of this year, Steel Improvement & Forge has forged about 75,000 lb of the metal, more than all the molybdenum the industry produced in 1956. The company started work with the

material in 1950. It developed precision forged turbine buckets in 1954 in a joint program with Climax Molybdenum Co., New York, and Westinghouse Electric Corp., Pittsburgh. Today, it forges parts weighing up to 340 lb.

• **Sintered Billets**—A recent development is the use of sintered molybdenum for the initial billet. A variety of forged components has been shaped. The forging operation gives the sintered material 100 per cent density and excellent ductility. Physical strength compares favorably with arc-cast molybdenum products.

The yield strength (offset method) of a 3 $\frac{5}{8}$ by 12 in. forged part was 98,000 psi. Its ultimate tensile strength was 107,250 psi.

James J. Russ, technical director of Steel Improvement & Forge, believes that development of the arc-cast and powder metallurgy fields will lead to new alloys with higher recrystallization temperatures. This will increase the temperature potential of molybdenum.

Retainers Improved

Reduction in oil-mass shift is assured by sintered nylon parts; aid in making guidance systems

NYSORB ball retainers provide improved lubrication for rotor bearings in internal guidance systems, and reduce oil-mass shift that causes navigational errors.

In tests, bearings with these retainers have operated without loss of performance for more than 5000 hours under severe preload and speed. Those with conventional retainers had an effective operating cycle of less than 200 hours.

The material uniformly retains 20 to 25 per cent of its own weight of oil under acceleration of over 800 g, and absorbs 10 to 20 times as much oil as conventional units.

• **Shift Minimized**—Since the lubricant is distributed evenly throughout the structure, there is little oil-mass shift to unbalance delicate guidance mechanisms.

Developed by Barden Corp., Danbury, Conn., the retainers enable gyros to achieve the life and precision performance demanded. They are sintered from finely divided nylon powder which is impregnated with an instrument oil under vacuum.

New View on Fatigue

Resistance to fatigue cracking—failure of a metal after continued flexing—is no less at the edges than on the flat surfaces of a metal specimen. This new approach to fatigue cracks and where they start was taken by the National Bureau of Standards in work for the National Advisory Committee for Aeronautics.

Initiation of fatigue cracks, first sign of metal failure, is important to design engineers.

Tests by the NBS show that differences in stress patterns, rather than lower resistance to cracking, cause fatigue cracks to start at the edge of a piece of metal. Specimens designed especially for the tests permitted direct comparison of fatigue strengths on flat surfaces with those occurring at the edges of the material.

Why **SHOULDN'T** I be interested in key man insurance?

"This is for sure . . . the brains of my key
men are my biggest business asset."

Almost every company has one or more key men who are responsible for its growth and continuing success. If death takes one of these men, the company stands to lose money . . . at least until a replacement can be found and trained.

You can avoid such a loss through Aetna Life's Key Man Insurance Plan. This plan provides the ideal method of protecting the *living value* of the important men in your business. It gives you the money you will need . . . *when* you need it . . . in the period of adjustment and replacement.

And during the lives of key men, the insurance has important cash values, giving you larger lines of credit and lower rates of interest.

Thoroughly trained representatives in 91 agencies from coast to coast are ready to offer you this unusual Aetna Life Business Planning Service.

ÆTNA BUSINESS LIFE INSURANCE PLANS ARE SPECIALLY DESIGNED . . .

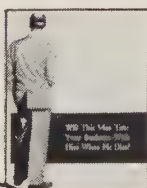

- To preserve **PARTNERSHIP** value when death comes to any partner.
- To preserve **SOLE PROPRIETORSHIPS** for heirs or selected employees.
- To preserve ownership values when death comes to any stockholder in a **CLOSE CORPORATION**.
- To indemnify any firm for the death of a **KEY MAN**.

tootsietoys

are painted by the millions with
RANSBURG NO. 2 PROCESS

Miniature automobile bodies of the tootsietoy line are efficiently and uniformly painted as trays of cars pass below one of the four Ransburg No. 2 Process atomizing bells.

QUALITY OF THE FINISH IS IMPROVED AND PAINT COSTS ARE CUT 65% WITH *Electrostatic Spray Painting*

Dowst Manufacturing Co., Chicago, are sticklers for quality in the production of tootsietoys which are turned out at the rate of 25 million a year.

That's one reason they changed from hand spray to Ransburg Electrostatic Spray Painting.

RESULTS? Rejects are cut from as much as 5% to about 1%, for they're getting a more uniform, higher quality coating on all parts.

Colors are changed easily, and paint mileage is stepped up substantially. For instance, on one toy item, a gallon of paint coated only 1800 units by hand spray. Now, with Ransburg No. 2 Process, they paint 5500 pieces per gallon. That's because of the unmatched efficiency of Ransburg No. 2 Process.

NO REASON WHY YOU CAN'T DO IT, TOO!

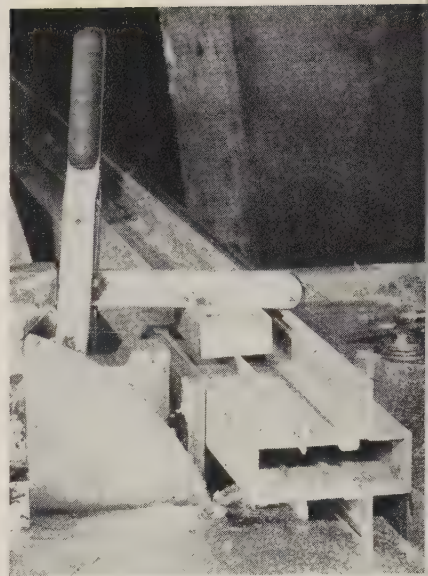

Whatever your product—whether it's large or small—we'd like to show you what RANSBURG ELECTROSTATIC PROCESSES can do for you in YOUR finishing department. Write for our No. 2 Process brochure which shows numerous production line examples of electrostatic spray painting on a wide variety of products.

CARBIDE TIPPED SAW

... cuts complex extrusions

Saws Are Rugged

Longer life, less resharpening, increase production, cut cost in fabricating tough bronze

COMPLEX extrusions in tough architectural bronze mean shorter life for saw blades. Frequent resharpening, replacement of broken teeth, and the need for deburring after sawing increase costs in bronze fabrication.

Cost reduction is possible through use of cemented carbide tipped saws.

Three Carboloy cemented carbide tipped saws have made more than 55,000 cuts through tough 85-15 architectural bronze without resharpening at Flour City Ornamental Iron Co., Minneapolis. Plant Superintendent John F. Svoboda says this is an increase of 70 to 1 in between-grind life over conventional saws.

The saws, made by Lemmon & Snoap Co., Grand Rapids, Mich., are solid discs with close-spaced teeth and no gullet. Saws 18, 16, and 10 in. in diameter are run at 3400, 3400, and 3000 rpm, respectively; after 14,000 cuts with the 10-in. saw and 21,000 cuts each for the larger ones, only the 10-in. needed resharpening.

Bronze extrusions of simple and complex cross sections can be cut with no subsequent deburring.

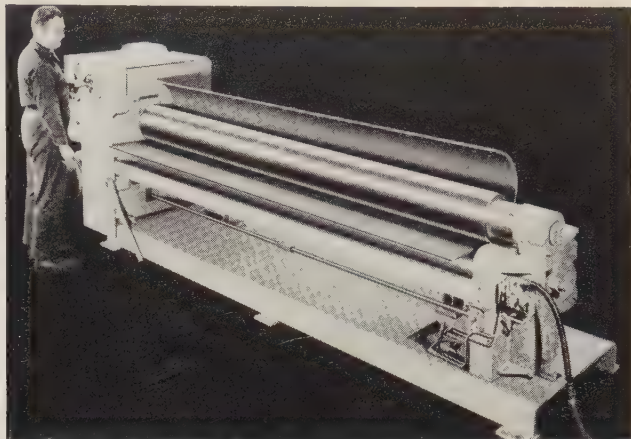

Plate Bending Rolls Have Instant Pushbutton Control

Finger-tip controls facilitate operation of these 9 and 10 in. diameter plate bending rolls. They quickly produce commercially true cylinders of metal plate up to $\frac{3}{4}$ in. thick.

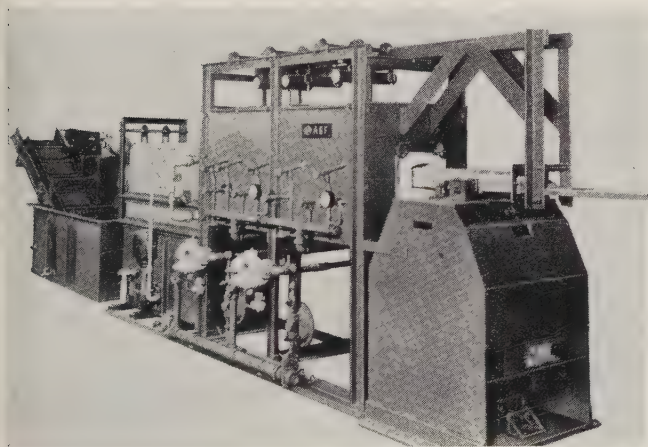

Complete, instant control over forward and reverse rotation is provided by a brake-type motor, momentary contact pushbuttons, and oversize magnetic contactors.

The brake stops the rolls instantly on release of buttons, prevents drifting, and provides close control for inching. Rolls deliver full torque immediately.

A heavy duty, worm gear drive runs silently in a bath of oil; all gears are enclosed. Flat spots in sheets of any thickness are virtually eliminated. *Write:* Niagara Machine & Tool Works, 683 Northland Ave., Buffalo 11, N. Y. *Phone:* Taylor 4070

Hearth Furnaces Have Water-Jacketed Cooling Extension

Bright annealing and bright hardening of small stainless steel parts at temperatures to 1900° F can be done in these reciprocating furnaces. Model No. 264 (shown) can handle about 100 lb of stainless parts an hour.

The principle of operation consists of imparting a forward movement to the work and interrupting it suddenly, causing the work to advance by momentum.

An enclosed alloy muffle has a purging, heating, and water-jacketed cooling section, and seals into an automatic conveyorized oil tank.

The muffle permits maintenance of dew points as low as -90° F, and its full seal construction insures complete atmosphere uniformity throughout the cycle. *Write:* American Gas Furnace Co., Elizabeth B, N. J. *Phone:* Adams 2-0017

Device Orients Parts Difficult To Handle

This packaged roll orientator is an aid to the feeding of headed or slightly tapered parts.

It aligns 100 per cent of the parts fed without rejects, regardless of position at discharge.

The unit can also be used to inspect parts by dropping those undersized.

Equipped with a photoelectronic control, the feeder supply remains constant without overloading. It can be used for various shaped parts that will hang vertically and it is extremely adaptable for feeding fragile ones without scratching or breaking them.

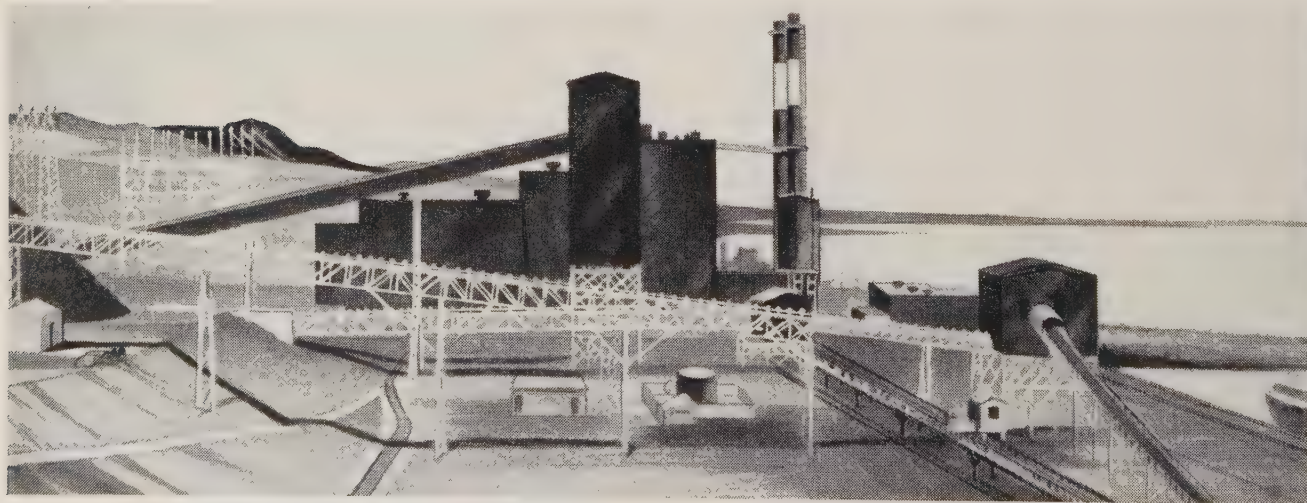

The unit can easily be adjusted to handle various sizes, and can be adapted to almost any delivery rate. *Write:* Automation Devices Inc., 3125 Brandes St., Erie, Pa. *Phone:* 4-6329

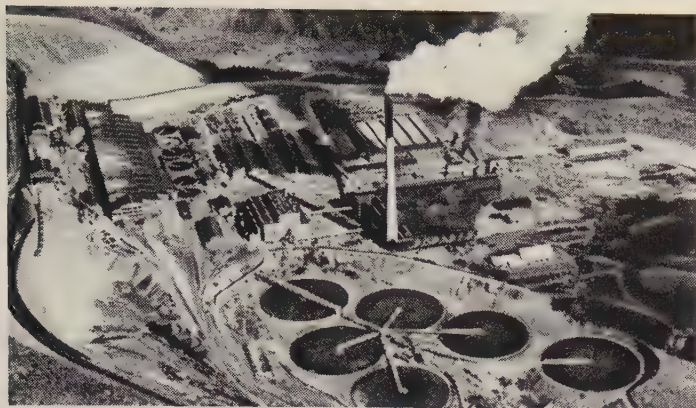

Announcing:

A new Anaconda subsidiary
offering a half-century
and a billion dollars'
worth of experience
in design and engineering
for industrial construction

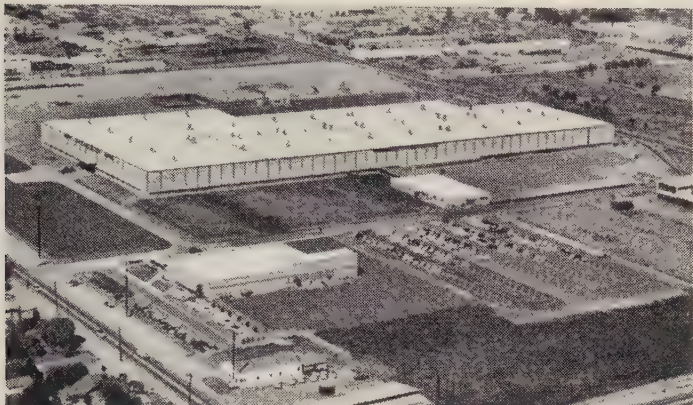

Anaconda-Jurden Associates, Inc., formerly Anaconda's Engineering Department, now offers the complete services of its experienced staff to industry generally.

ENGINEERED BY ANACONDA: Power Plant for Erie Mining Company's Taconite Project at Hoyt Lakes, Minnesota.

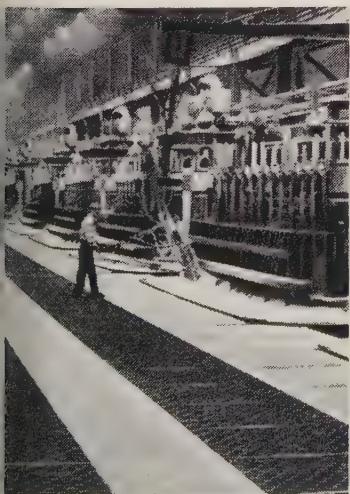

ENGINEERED BY ANACONDA: Phelps Dodge Copper Reduction Works, Morenci, Arizona.

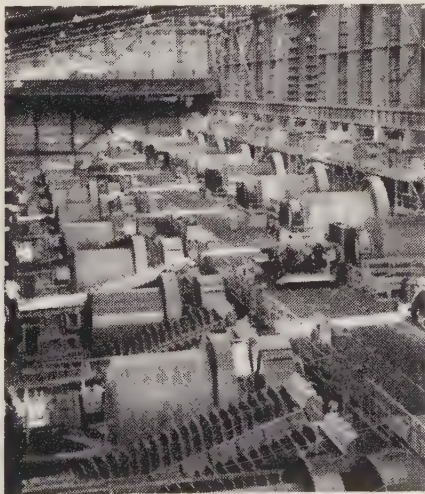

ENGINEERED BY ANACONDA: Integrated Brass Mill, The American Brass Company, Los Angeles, California.

ENGINEERED BY ANACONDA: Uranium Processing Plant of The Anaconda Company, Grants, New Mexico.

ENGINEERED BY ANACONDA: Refining Plant, Anaconda Aluminum Company, Columbia Falls, Montana.

ENGINEERED BY ANACONDA: Concentrator Grinding Bay, Chile Exploration Company, Chiquimata, Chile.

For more than fifty years, Anaconda has been in the business of designing and engineering some of the largest metallurgical and industrial plants in the Western Hemisphere—over a billion dollars' worth since World War II.

Anaconda's engineering department has not only built plants for the parent company and its many subsidiaries, but for other companies as well. Projects have included the design of the plant proper and such adjuncts as power plants, transmission lines, complete townsites, bridges, road systems, warehouses, offices, laboratories, water supply and sewage disposal systems.

This highly experienced engineering staff has now been formed into a new Anaconda subsidiary—Anaconda-Jurden Associates, Inc.—so that its services can be extended more readily to other clients.

Wilbur Jurden, president and chief engineer of the new concern said, "The development of a well-coordinated team of design specialists requires years working together on the attainment of common goals. Ours is a balanced staff of over 200 highly trained engineers eager to accept new challenges in the design, engineering, and construction of any major industrial facility."

The formation of Anaconda-Jurden Associates is another major step in Anaconda's continuing efforts to provide better service and products for American industry.

If you would like to learn more about Anaconda-Jurden Associates, Inc., send for a complimentary copy of our brochure, "Landmarks of Industrial Engineering." Simply write to Anaconda at 25 Broadway, New York 4, N. Y.

Drive Is Compact

A variable speed caterpillar drive is available for Alvey-Ferguson overhead trolley conveyors. Compact construction holds down headroom requirements.

Mounting the drive sprocket directly on the slow speed shaft of the vertical-type reducer has eliminated the bulky spur gear and pinion.

Floating and fluid drives, and automatic overload cutoffs can be provided. Write: Alvey-Ferguson Co., 2886 Disney St., Cincinnati 9, Ohio. Phone: Redwood 1-7000

Platform Loads Trucks

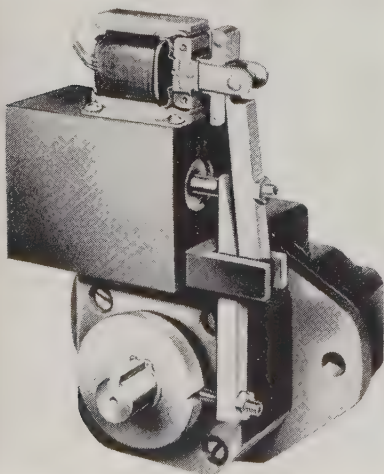

The One-Man truck loader is a portable platform with a capacity of 1 to 3 tons, and a range of up to 20 ft.

It is easily moved on retractable casters. The standard platform is 4 x 4 ft. Other sizes are available.

It is electrically operated with floor or platform control, or both. Write: Atlas Industrial Corp., 849 39th St., Brooklyn 32, N. Y. Phone: Gedney 5-5520

Drive Indexes Machines

This one-revolution drive is an accurate and automatic intermittent device for indexing motions, feed-

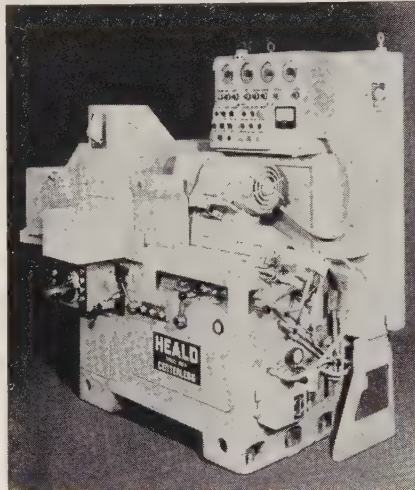

ers, turntables, packaging machinery, and office equipment.

It produces smooth, quiet, instant high torque through a fluid motor and planetary reduction.

The unit may be adapted for manual or mechanical starting, or multirevolution operation. Write: Constant-Flo Div., John S. Barnes Corp., 301 S. Walter St., Rockford, Ill. Phone: 4-5631

Grinder Table Inclined

Two internal grinders feature Rite Angle design—the table is inclined at 30 degrees to the work. This prevents any tendency to lift when the work is fed into the wheel. It also provides solid wheel backing for heavy pressure, true table tracking, excellent swarf and coolant drainage, and a superior base for mounting wheelheads.

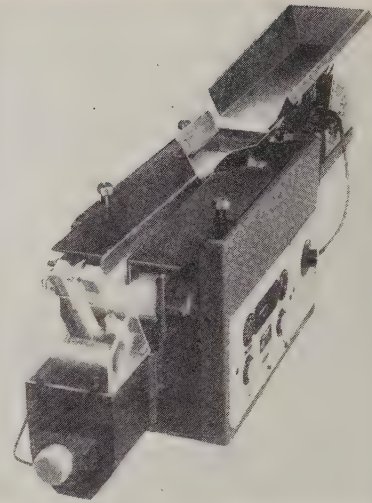

The Model 180A roll-type centerless machine (shown) is designed for small to medium size work that can be rotated on its own OD. The Model 170A chuck-type internal is a high production machine for automatic chucking of small to medium size work that cannot be rotated on its own OD. Write: Heald Machine Co., 2 New Bond St., Worcester 6, Mass. Phone: Pleasant 5-3191

Small Items Batched

A portable device, the FCB-1, feeds, counts, and batches small items. It can tabulate 300 to 1000 pieces a minute.

Its Decitron Preset Counter keeps accurate tabulation at conveyor speeds of 150 ft a minute. All items are stored in a batcher, and when the desired count is reached (pre-

viously selected on the counter) the items are dropped into containers.

The device can be furnished for batch counting in any amount from 1 to 1 million. Write: Post Electronics, Beverly, Mass. Phone: Walker 2-5006

Degreases Small Parts

The Econo-Sonic is a complete ultrasonic solvent degreasing unit, priced for small shops, that handles small parts requiring special care.

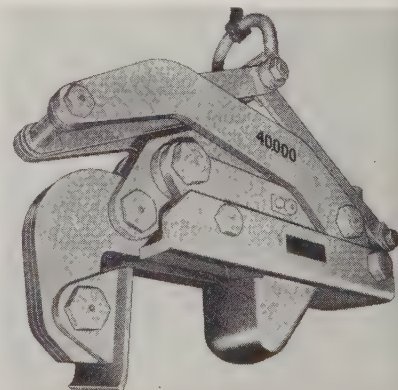

It has boil and rinse chambers, complete circulation and filtration, and a spray lance.

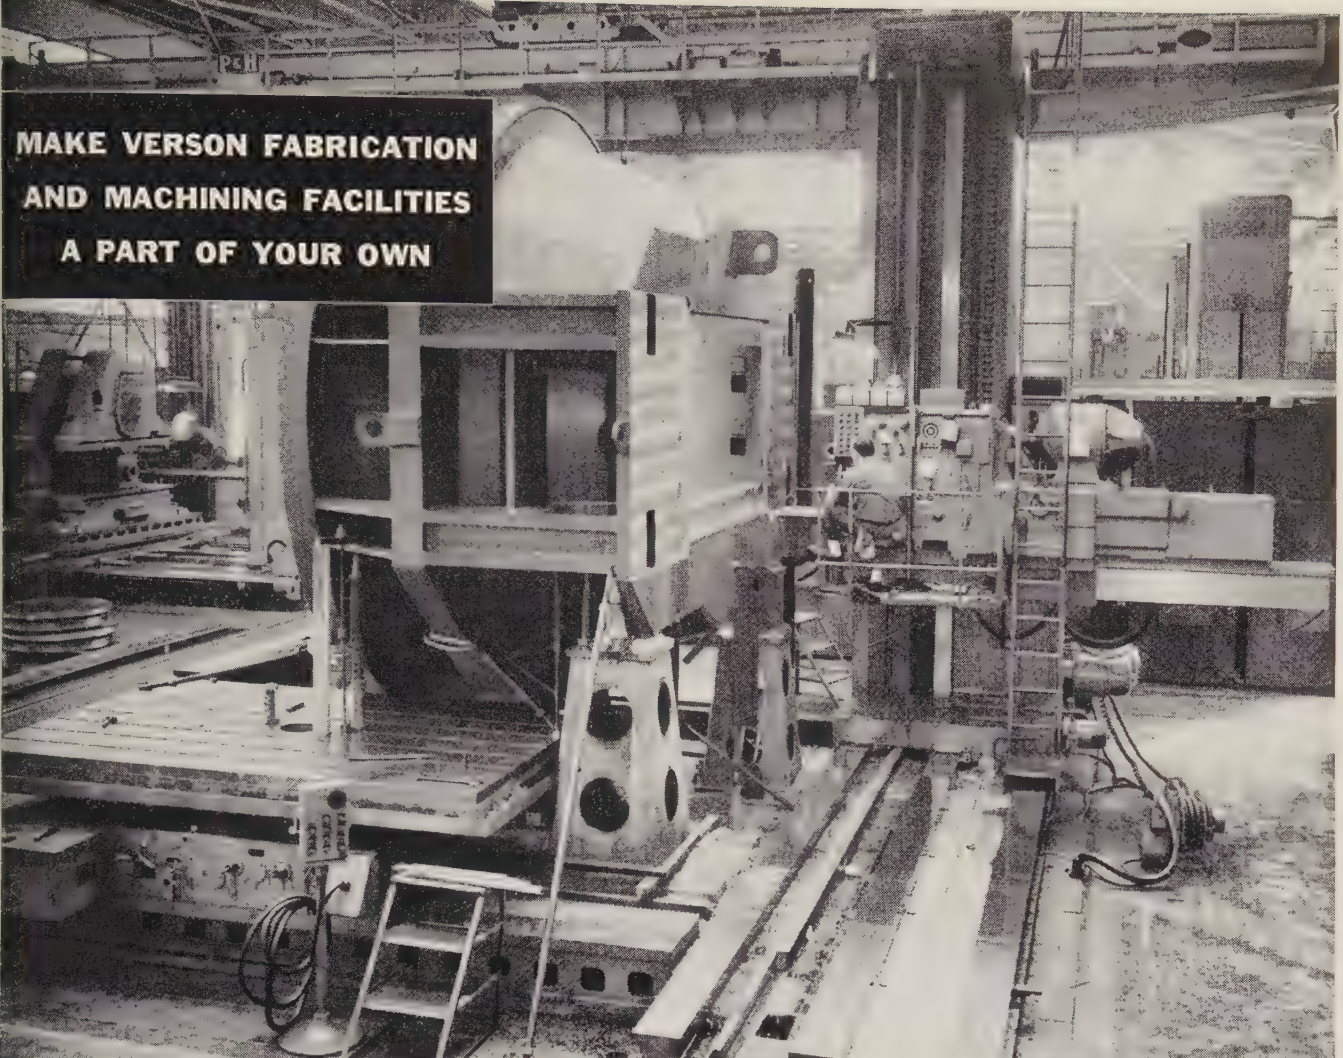

Included is a 110 volt, 600 watt 400 kc generator. Write: Detrex Chemical Industries Inc., Box 501, Detroit 32, Mich. Phone: Townsend 8-8600

Tongs Aid Lifting

Cranehand automatic mechanical handling tongs are for use in areas where space is too small for lift truck operation.

They operate from mill or S-hooks, and are designed for large material handling operations such as bars, billets, ingots, pipe, coils

**MAKE Verson FABRICATION
AND MACHINING FACILITIES
A PART OF YOUR OWN**

The Verson Contract Machining Division offers complete machining and gear cutting services for requirements beyond the capacity of your equipment

Big machining jobs require big machines. If your space is limited or if the capacity of your tools is inadequate for jobs you have on hand, you can expand your plant without capital investment through the use of Verson's Contract Machining Division.

Here you will find huge milling, boring and drilling machines, lathes and planers . . . the most modern facilities available anywhere. For the fabrication and machining of medium and large sized spur or herringbone gears, Verson also offers facilities second to none . . . and Verson methods and

techniques get the most out of these facilities.

For precision machining or gear cutting that meets your most rigid specifications, contact Verson, today. For quotations, send an outline and drawings of your requirements.

CONTRACT FABRICATING

The Verson Contract Fabricating Division offers complete, modern facilities for all your steel plate fabricating requirements. For full details, write for Bulletin F-57 . . . or send an outline of your needs.

9318 S. KENWOOD AVENUE, CHICAGO 19, ILLINOIS • 8300 S. CENTRAL EXPRESSWAY, DALLAS, TEXAS

MECHANICAL AND HYDRAULIC PRESSES AND PRESS BRAKES • TRANSMAT PRESSES • TOOLING • DIE CUSHIONS • Verson-WHEELON HYDRAULIC PRESSES

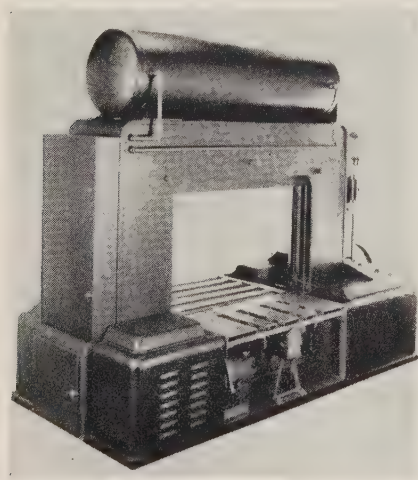

structural steel, rails, or storage racks.

An automatic lock opens upon contact with the load without the aid of electric power or mechanical devices. Capacities range from 1000 to 50,000 lb. Maximum opening is 50 in. *Write:* American Forge & Mfg. Co., McKees Rocks, Pa. *Phone:* Spaulding 1-4514

Unit Straps Automatically

Autostrapper machines use oval shaped steel strapping with a high tensile strength. They can be used to reinforce extralarge bales, pallet loads, cases, and cartons.

The equipment twist-ties the strapping to produce a guaranteed

joint strength of up to 900 lb. Conventional round strapping up to 12 gage can be used.

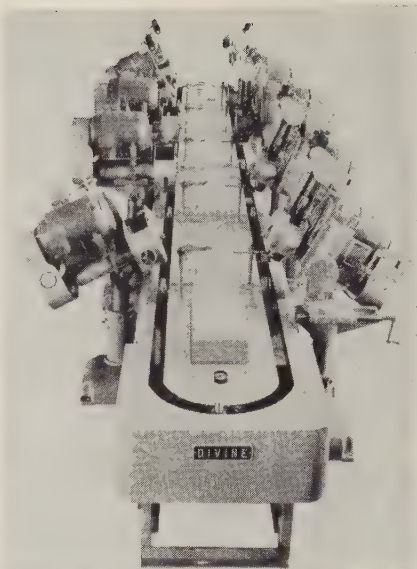

Conveyorized models automatically position the product, initiate the machine cycle, and remove the package. *Write:* Wiretyer Corp., 65 Leliarts Lane, East Paterson, N. J. *Phone:* Swarthmore 7-6180

Conveyor Aids Buffing

An indexing-type circuit conveyor has been produced for use with Type L and Type V polishing and buffing head units on automatic installations.

Welded of heavy structural steel, the unit is sectional to permit expansion or rearrangement. It also facilitates shipping.

The conveyor runs at maximum speed between work stations regardless of the number of indexes per

hour, and speed adjustments are infinitely adjustable throughout their range. *Write:* Divine Bros. Co., Seward Avenue, Utica, N. Y. *Phone:* 4-7174

Compound Cleans Metal

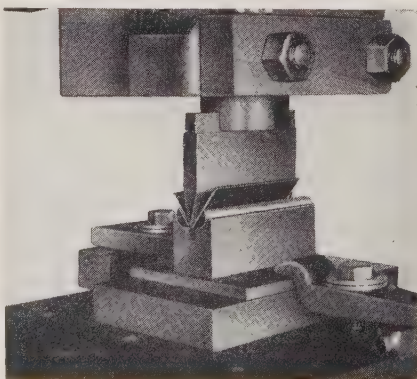

An alkaline material is available to clean ferrous metals and copper alloys. The compound is highly effective for oil and grease removal and uses a minimum of active ingredients.

No films are left after cold or warm rinsing. Operating temperature is 180° F. *Write:* Stratford Chemical Co. Inc., Honey Street, Milford, Conn. *Phone:* Trinity 8-0392

Work Marking Avoided

This female die has roll inserts that eliminate work marking and reduce die setup and changeover time. It can be used in any press brake or punch press.

The Di-Acro Rol-Form dies are particularly useful where polished, painted, or bright metals are being formed.

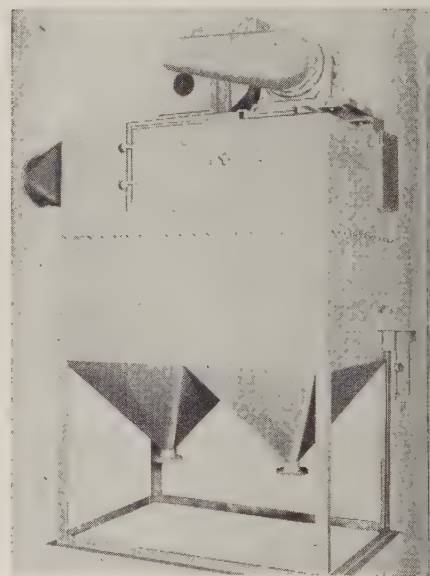

The die block houses two hardened and ground, half-round inserts that roll up and toward the opening in the die block as the male die enters the workpiece.

Up to 12 ft standard lengths can be obtained for press brakes, and shorter sections are available for punch presses. *Write:* O'Neil-Irwin Mfg. Co., 619 Eighth Ave., Lake City, Minn.

Dust Control Increased

Redesigned diffuser elements for a hydroprecipitator-scrubber, dust control unit have increased its efficiency in the trapping of noncondensable and normal dust-type materials (below 5 microns in size).

The scrubber removes low and submicron size dust particles and

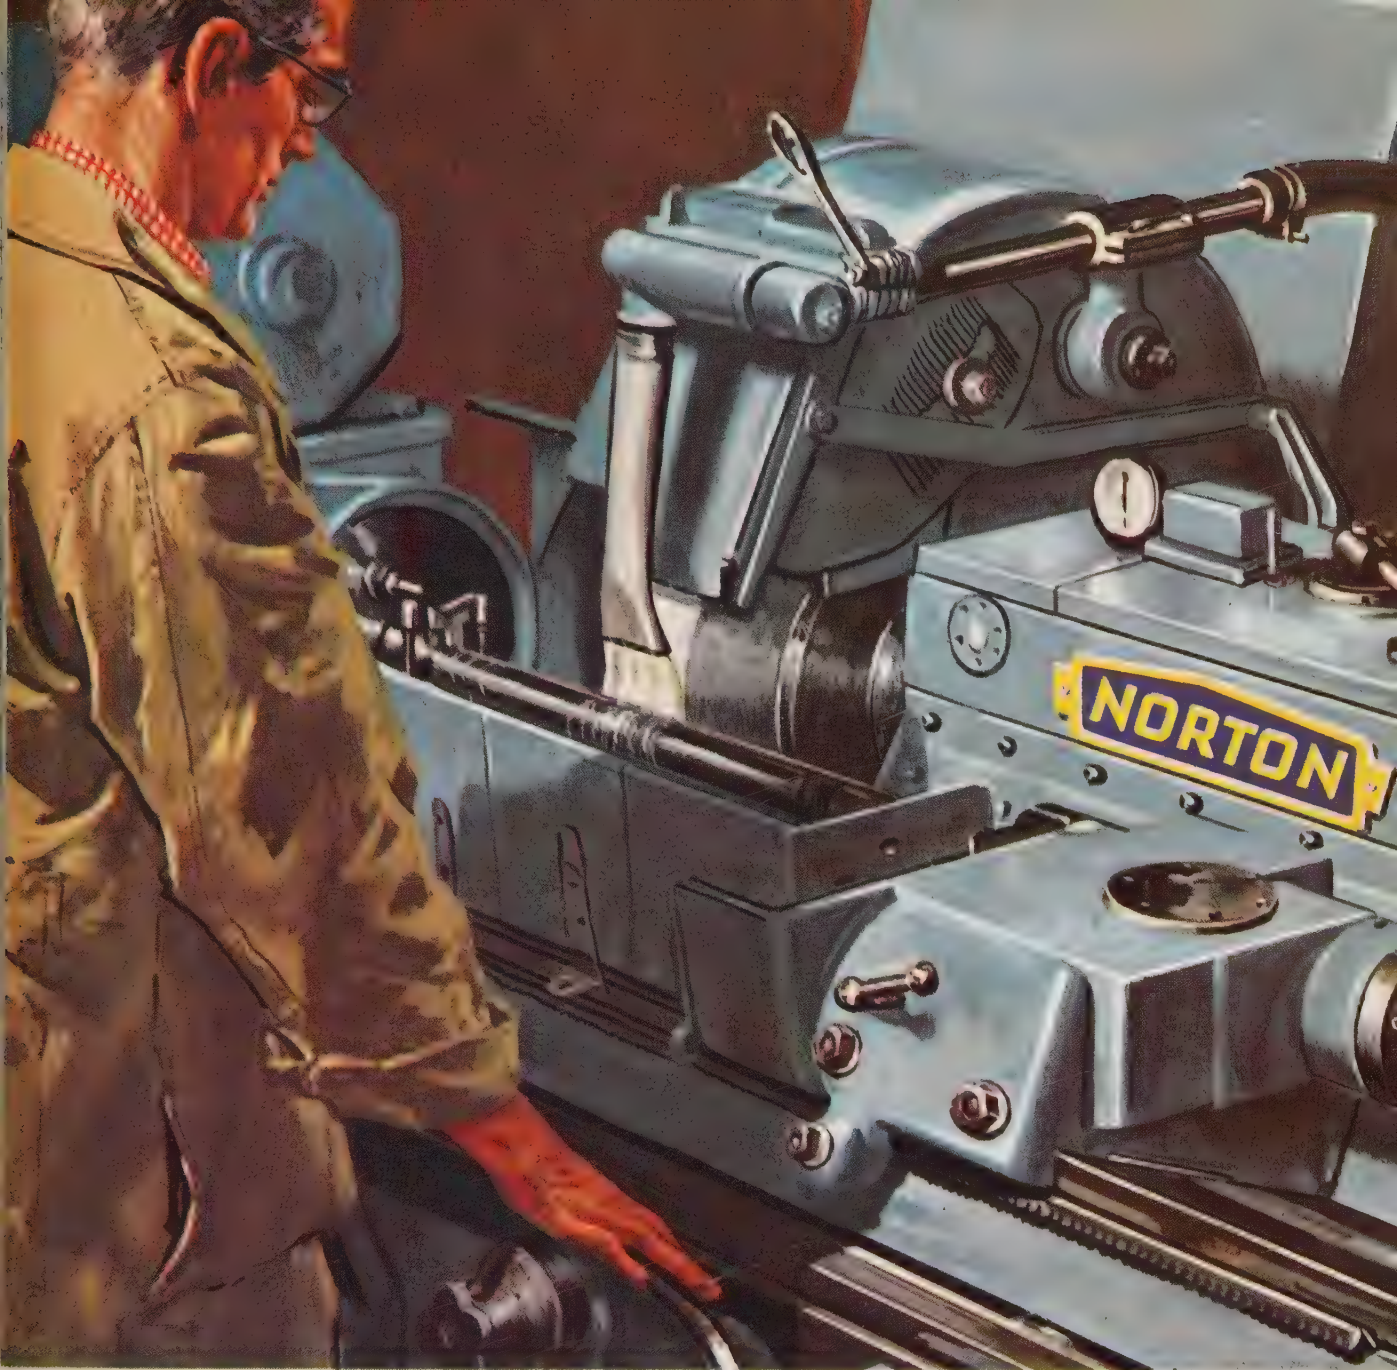

fumes in gases exhausted from steel plant blast furnace, open hearth, and sintering operations.

Efficiency up to 99 per cent has been obtained with 90 per cent of the material below 5-micron particle size. *Write:* Johnson-March Corp., Philadelphia 3, Pa. *Phone:* Locus 4-0536

Unit Checks Clearances

Checking the clearances between the ID and OD of mating parts to millionths can be done with the Air-O-Limit 3-Station ID-OD Clearance Comparator.

The device is a combination of two gaging units plus a computing circuit. The output of the gaging units is fed into a computing relay, and the clearance or interfer-

Continuous high production plus precision are built into this CTU cylindrical grinder.

You, too, can have the "Touch of Gold" with a Norton Grinding Machine

This is one of the most profitable machines industry knows. It is widely used for the demanding tasks of production precision cylindrical grinding. It is a product of Norton Company's ingenuity and knowledge of the great and varied science of grinding . . . one in which Norton has specialized for scores of years . . . a field

in which it has become world leader.

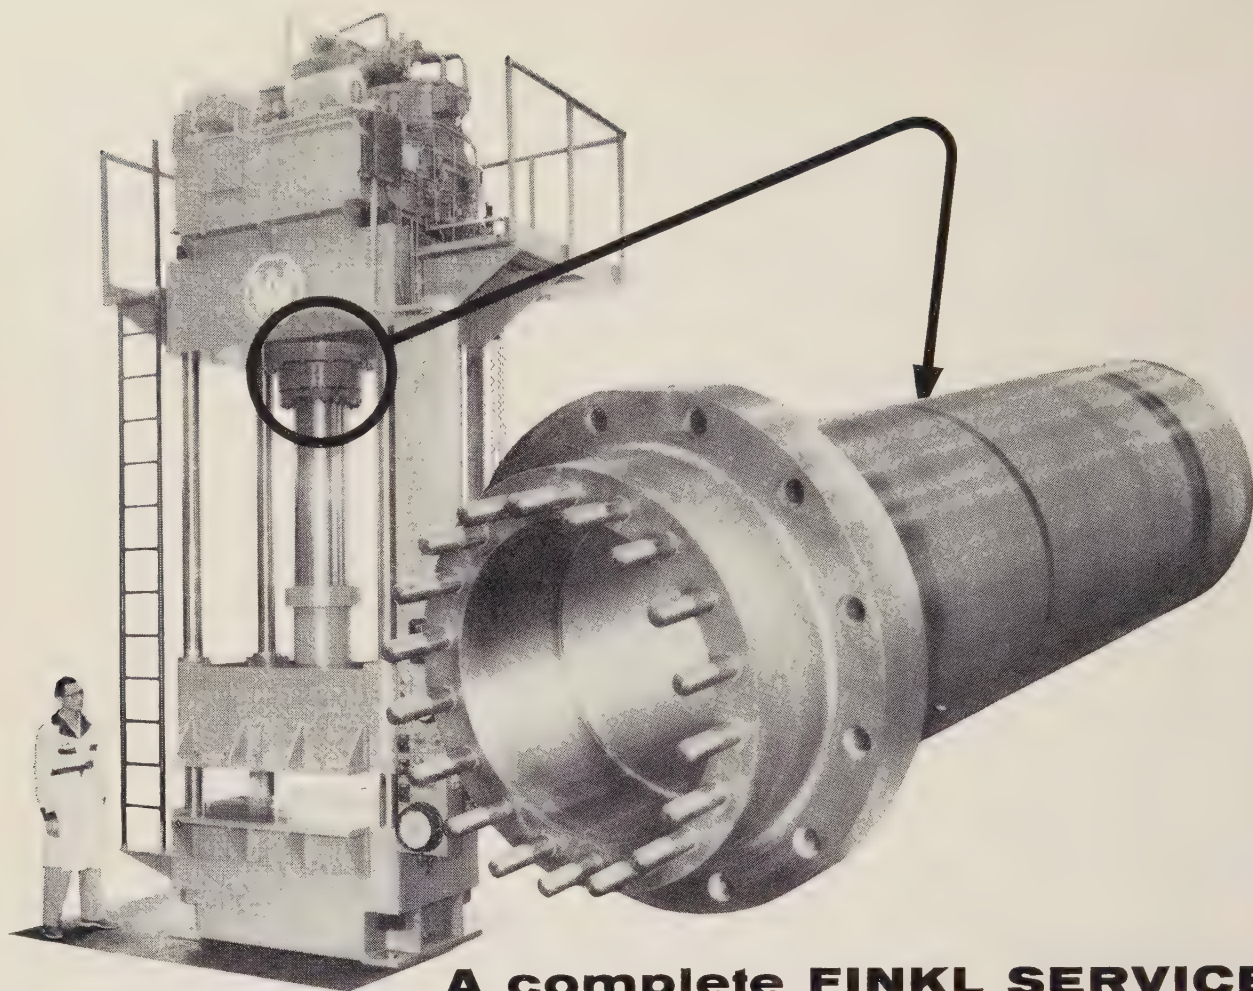

You literally have the "Touch of Gold" when you use a Norton Grinder. Its ability to produce faster and with greater precision is added value that creates more wealth . . . helps everybody earn more.

It will pay you to inquire how Norton Grinding Machines and Lap-

pers can give your company the "Touch of Gold." NORTON COMPANY, Worcester 6, Massachusetts.

A complete FINKL SERVICE - FROM BLUEPRINT TO FINISHED PART

Many companies profit from Finkl's complete package service on finished machine parts. Williams-White & Company of Moline, Illinois, manufacturers of heavy machinery, called on Finkl for the forged steel, main cylinder shown above. It is used on a 300 ton plastic molding press employed for pilot molding procedures prior to production molding runs.

The entire cylinder was handled in our plant. Made of C-1035 steel from our electric furnace melt shop, the part was forged, heat treated, rough and finished machined under one roof. The 17" bore was ground to $+.003''$. Final dimensions, as delivered and installed, were 6'-1" long with the main body 22" in diameter.

With modern equipment and skilled craftsman, we do jobs both larger and smaller than the cylinder shown. The important thing is we do all of them well. Next time you are planning a machine part call a Finkl engineer and learn how you can profit by having it done under one roof.

"Custom manufacture" has a special meaning at Torrington, where our Specialties Division produces a tremendous variety of small precision metal parts. For our engineers often help in designing parts for our customers, and as frequently develop special equipment or methods for most efficient production.

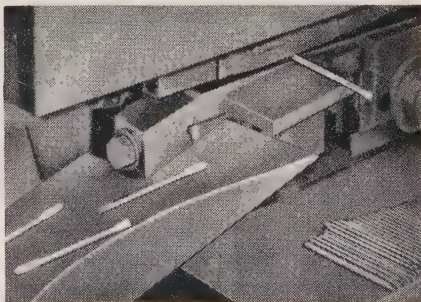

For example, one of our current contracts is for jewelers' screwdriver blades. In this case, our engineers decided to swage these parts to give the required high-strength characteristics without stress concentration points and tool marks. Other features of these parts are good dimensional accuracy and closely controlled heat treating for hardness and temper.

In another case, we received a blueprint of a special pinion axle with an accurately cut retaining ring groove at one end. The customer inquired whether this part could be produced at about the same price as a straight cylindrical axle with an uninterrupted OD. The answer was "Yes!" Specialties engineers decided that high-speed cutoff and groove-turning

equipment would have to be built to cope with the high volume involved. Special pinion axles have now joined the great number of parts being produced by Torrington Specialties Division.

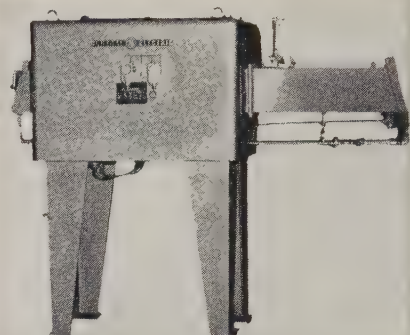

Whatever the part, whatever the operation—even operations tailored to the part requirements—Torrington's Specialties Division is uniquely equipped to handle your small precision parts contracts. Highly specialized fluting opera-

tions, for example, permit volume production to close tolerances. Precision swaging, knurling, forming, milling, drilling are among other operations for which we are fully equipped. Advanced heat treat and statistical quality control methods help provide the quality product you require.

For help with your custom-built small precision metal parts in large quantities, just circle our number on the reply card. Or have your Purchasing Agent call our area salesman, or write direct to:

Plastic Steel

Bulletin No. 3 discusses the use of Plastic Steel for maintenance and general repairs. Devcon Corp., Danvers, Mass.

Open Floor Grating

A 16-page catalog describes stair treads and open floor grating for industrial uses. Reliance Steel Products Co., P. O. Box 510, McKeesport, Pa.

Right-Angle Gear Drives

Solutions to a variety of industrial power transmission problems with standardized 90-degree power takeoffs are provided in Catalog IA-58. ANGLgear units serve in place of V-belts or chain-and-sprocket mechanisms. Airborne Accessories Corp., 1414 Chestnut Ave., Hillside 5, N. J.

Gear Reducers

Catalog No. 5802 contains engineering and selection information on the Speed-Master gear reducer line. The reducers are available in a wide range of ratios up to 10,000 hp. Western Gear Corp., P. O. Box 182, Lynwood, Calif.

Cutting Lance

The Oxweld ACL-3 Powder Lance, capable of slicing through metal or concrete of any thickness, is described in Form 1153. Linde Co., division of Union Carbide Corp., 30 E. 42nd St., New York 17, N. Y.

Hydraulic Press

Hydraulic presses from 17½-ton bench size through 30, 50, and 100 ton units are described in Manual SP8. All are powered by the center-hole ram which may be removed for optional use in the shop or on a job site. Owatonna Tool Co., Owatonna, Minn.

Special Lubricant

Bulletin No. 559 describes the use of Non-Fluid oil for shake-outs, vibrating screens, and pneumatic tools and equipment. New York & New Jersey Lubricant Co., 292 Madison Ave., New York 17, N. Y.

OBI Press

A 40-ton OBI press with a steel frame weldment that provides large ram and bed areas and depth of throat for large die sets is described in a bulletin. Sales Service Machine Tool Co., 2363 University Ave., St. Paul 14, Minn.

Circuit Breakers

Bulletin GEA-5915 provides details on the operation and application of AK-2 breakers for circuits up to 600 volts ac and 250 volts dc. General Electric Co., Schenectady 5, N. Y.

Industrial Valves

A condensed version of this company's general catalog lists its complete line of industrial valves. Ohio Injector Co., Wadsworth, Ohio.

Graphite Electrodes

This folder highlights recent developments in graphite electrodes for electric furnaces. It contains a listing of stock threaded electrodes and their nipples. Great Lakes Carbon Corp., 18 E. 48th St., New York 17, N. Y.

Tool Steels

A tool steel stock list, No. 13, includes new steels, increased stock sizes, brand name chart of 13 producers, temperature conversion chart, tables of wire and sheet metal gages, and other engineering data. Uddeholm Co. of America Inc., 155 E. 44th St., New York 17, N. Y.

How To Start Motors

Methods of starting various types of synchronous motors are described in Bulletin GER-1520. Covered are starting under full voltage, part winding, autotransformer, primary resistor, primary reactor, wye-delta, and field excitation. General Electric Co., Schenectady 5, N. Y.

Spent Pickle Liquor

Neutralization of Spent Pickle Liquor discusses each of the many factors over which control can be exercised to keep costs of this expensive process to a minimum. The findings were developed from research sponsored by the American Iron & Steel Institute. Mellon Institute, 4400 Fifth Ave., Pittsburgh 13, Pa.

Special Stainless Steel

Microrold Special Purpose Stainless Steels is a 32-page book that gives detailed information on special purpose stainless physical properties and analysis, corrosion and heat resistance, surface finishes, fabrication, maintenance, and bacteria cleanability. Washington Steel Corp., Washington, Pa.

Alloy Steels

Quick Facts About Alloy Steels (Booklet 415-C) includes nine tables on AISI and SAE specifications for open hearth and electric furnace alloy steels—bars, billets, blooms, and slabs. Subjects covered: What is an alloy steel? Effects of Elements, Grain Size, Heat Treatment, and Determining Depth Hardness. Bethlehem Steel Corp., Bethlehem, Pa.

Phosphating Analysis Kit

A phosphating analysis kit enables metalworking manufacturers to determine if their products are adaptable to phosphating and to its paint adhesion advantages. Turco Products Inc., 6135 S. Central Ave., Los Angeles 1, Calif.

Lubrication Systems

Applications and advantages of the Ram-Pump centralized power lubrication systems are described in Bulletin No. 812. The units provide automatic or semiautomatic lubrication of bearings simultaneously, on single machine units while in operation. Lincoln Engineering Co., 5702 S. 33 Natural Bridge Ave., St. Louis 20, Mo.

Casting Alloys

Metal Specifications and Practices in the United States contains graphs, photomicrographs, and electron micrographs along with the text to show the development and standardization of casting alloys. WaiMet Alloys Co., 1999 Guoin St., Detroit 7, Mich.

Material Handling

How Rapistan equipment solves material handling problems in industry is set forth in a handbook. Sections cover Gravity, power, live storage, overhead special use, and industrial conveyors; accessories and casters; wheels; and hand trucks. Rapids-Standard Co. Inc., Grand Rapids, Mich.

Toolroom Shaper

A brochure describes the H-20, an economical, precision toolroom shaper that is guaranteed for an accuracy of ± 0.0001 in. for 6 in. Jersey Mfg. Co., 453 Livingston St., Elizabeth 1, N. J.

Buying Alloy Steel

A special eight-point plan that gives added protection to buyers of alloy steel is explained in a booklet. Joseph T. Ryerson & Son Inc., Box 8000-A, Chicago 80, Ill.

Ductile Iron

A catalog on ductile iron describes its broad range of applications and benefits. Hamilton Foundry & Machine Co., 155 Lincoln Ave., Hamilton, Ohio.

Electroplating Filters

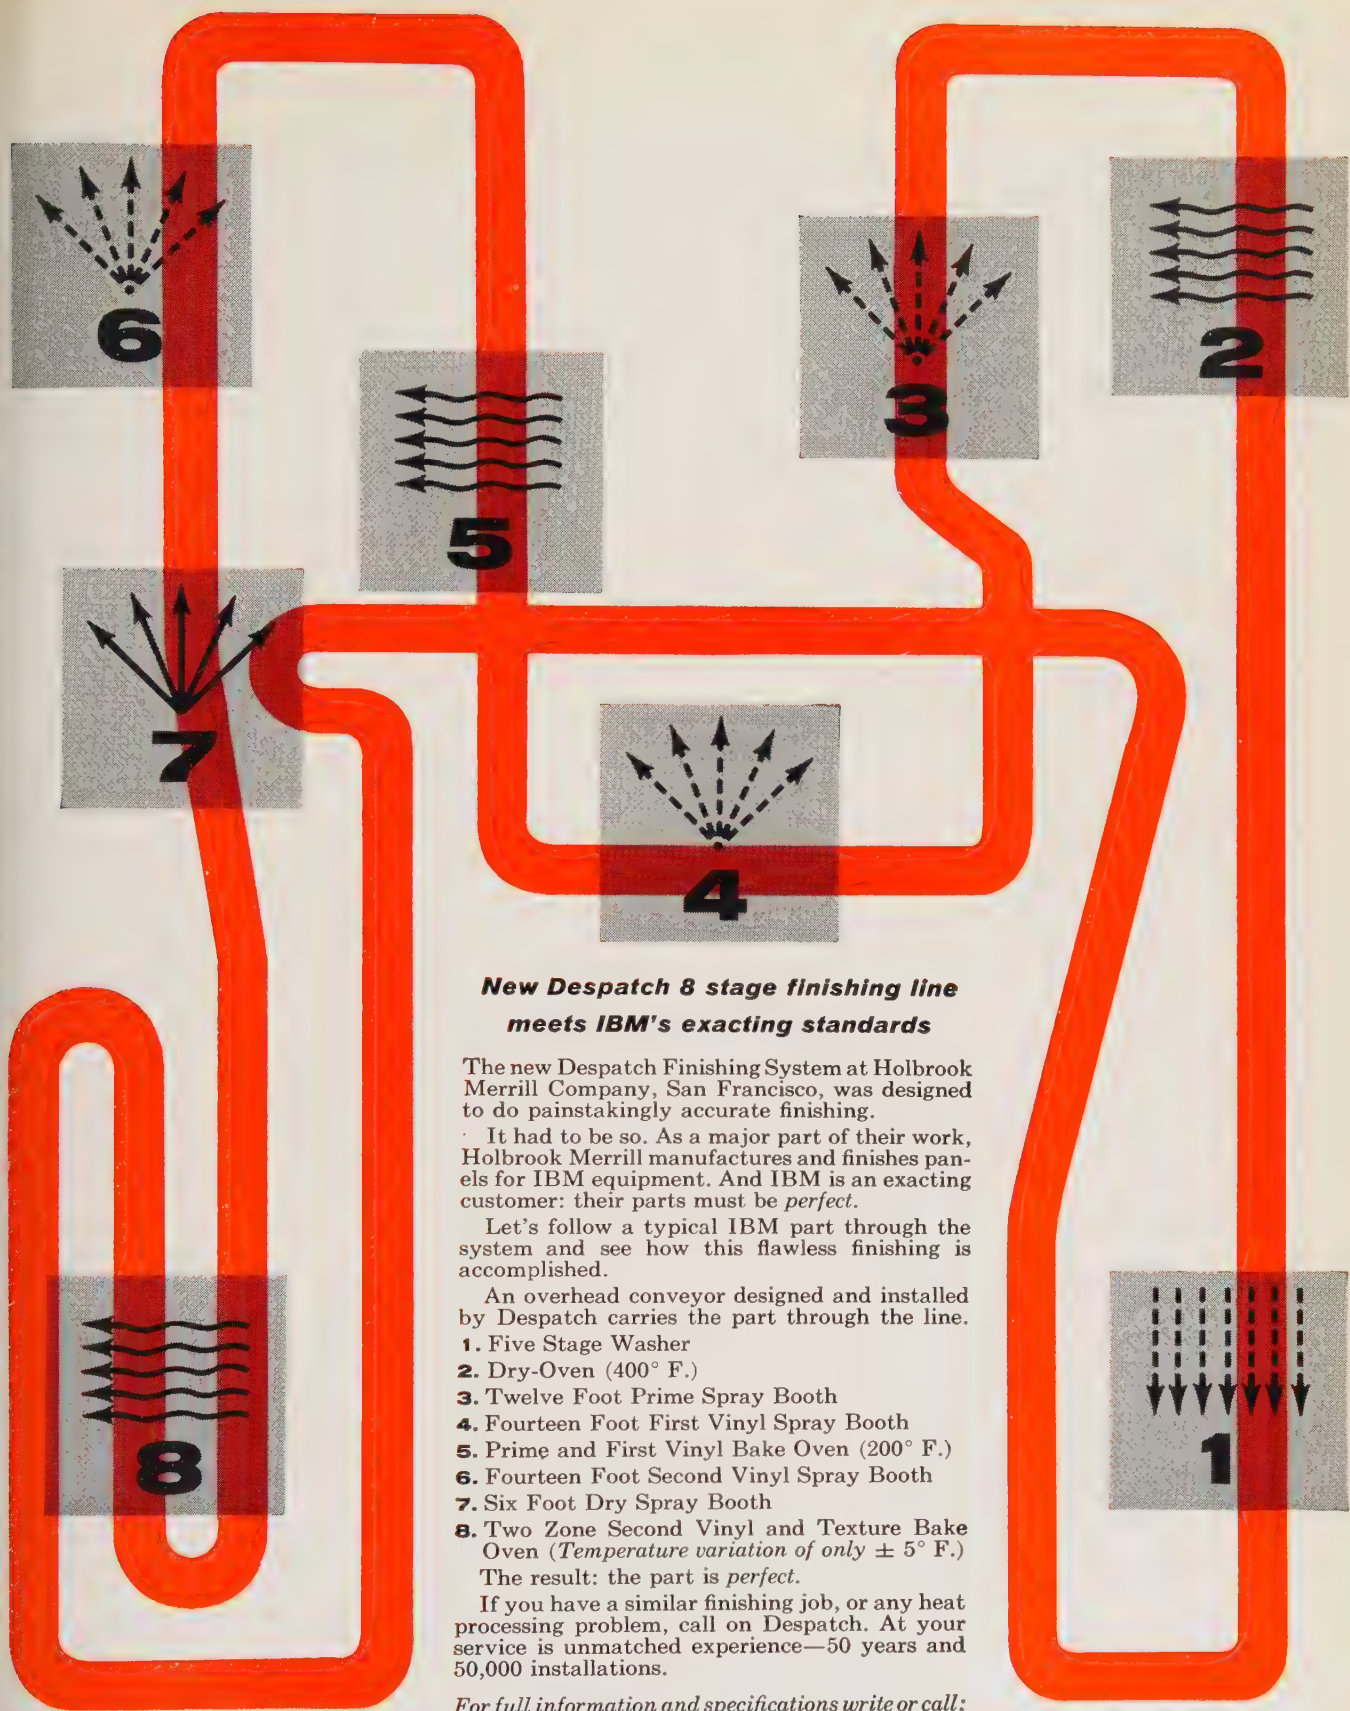

Fulflo filters allow complete solution filtration up to four times in a standard 8-hour day, says Bulletin GEO-508. Commercial Filters Corp., Melrose, Mass.

Helixpoint Drills

A bulletin tells about the production of helixpoint drills on the Steptool Relie Grinding Fixture. It also sharpens cor-drills, stepdrills, countersinks, and tap-drills. Steptool Corp., 3613 E. Olympic Blvd., Los Angeles 23, Calif.

Drilling Practice

How spiral point drill geometry provides improved precision and economy in drilling operations is shown in a booklet. Cincinnati Lathe & Tool Co., 320 Disney St., Cincinnati 9, Ohio.

**New Despatch 8 stage finishing line
meets IBM's exacting standards**

The new Despatch Finishing System at Holbrook Merrill Company, San Francisco, was designed to do painstakingly accurate finishing.

It had to be so. As a major part of their work, Holbrook Merrill manufactures and finishes panels for IBM equipment. And IBM is an exacting customer: their parts must be *perfect*.

Let's follow a typical IBM part through the system and see how this flawless finishing is accomplished.

An overhead conveyor designed and installed by Despatch carries the part through the line.

1. Five Stage Washer
2. Dry-Oven (400° F.)
3. Twelve Foot Prime Spray Booth
4. Fourteen Foot First Vinyl Spray Booth
5. Prime and First Vinyl Bake Oven (200° F.)
6. Fourteen Foot Second Vinyl Spray Booth
7. Six Foot Dry Spray Booth
8. Two Zone Second Vinyl and Texture Bake Oven (Temperature variation of only $\pm 5^\circ$ F.)

The result: the part is *perfect*.

If you have a similar finishing job, or any heat processing problem, call on Despatch. At your service is unmatched experience—50 years and 50,000 installations.

For full information and specifications write or call:

YOUR STEEL SERVICE CENTER

COLD FINISHED BARS

readily available from your Steel Service Center, help keep your inventory costs down, avoid production delays, and free your capital for more productive uses.

Have you learned the BIG LESSON from the recent recession?

It's expensive to tie up capital and space in steel stocks! When orders fall off, your cost of ownership—interest, space rental, maintenance, and insurance—continues.

This kind of expense for cold finished bars can be eliminated—or at least reduced substantially—by taking *planned* advantage of the services of your local Steel Service Center, your nearest distributor stocking steel products.

Virtually every steel buyer thinks of his Steel Service Center in an emergency—and this is fine. But even bigger returns may be realized by taking *planned* advantage of your Steel Service Center for your routine purchases.

Your distributor of cold finished bars has a wide variety of shapes, grades and sizes available for prompt delivery, and specialized cut-to-order service takes only a little longer. Plan to use *his* space for your steel stocks, *his* capital for inventory,

his equipment, and *his* prompt cut-to-order service—and production coordinated deliveries—for higher productive efficiency. Many others already do—American Steel Warehouse Association figures reveal that over 14 million tons of steel were handled in this manner in 1957.

Steel Service Centers are a vital segment of America's steel distribution system, and the distributor nearest you stocking cold finished bars can help you reduce the cost of your steel ownership. Call in his representative and get the full story on taking *planned* advantage of the services of his firm and its facilities. And ask him to show you the new ASWA slide film presentation, "George Wilkins Fights Back"; you'll find it both interesting and rewarding.

Jones & Laughlin Steel Corporation,
Dept. 562, Three Gateway Center, Pittsburgh 30, Pennsylvania.

MATERIALS HANDLING EQUIPMENT is expensive—as is the skilled labor to operate it—but you can reduce these costs by taking *planned* advantage of the services and facilities of your nearest distributor of J&L cold finished bars.

EXACTING QUALITY CONTROL MEASURES assure superior finish, machinability, and uniformity in J&L's cold finished bars. Ask your salesman to show you samples of J&L's improved Bright-Drawn finish, the "new look" in cold drawn bars.

Jones & Laughlin Steel Corporation

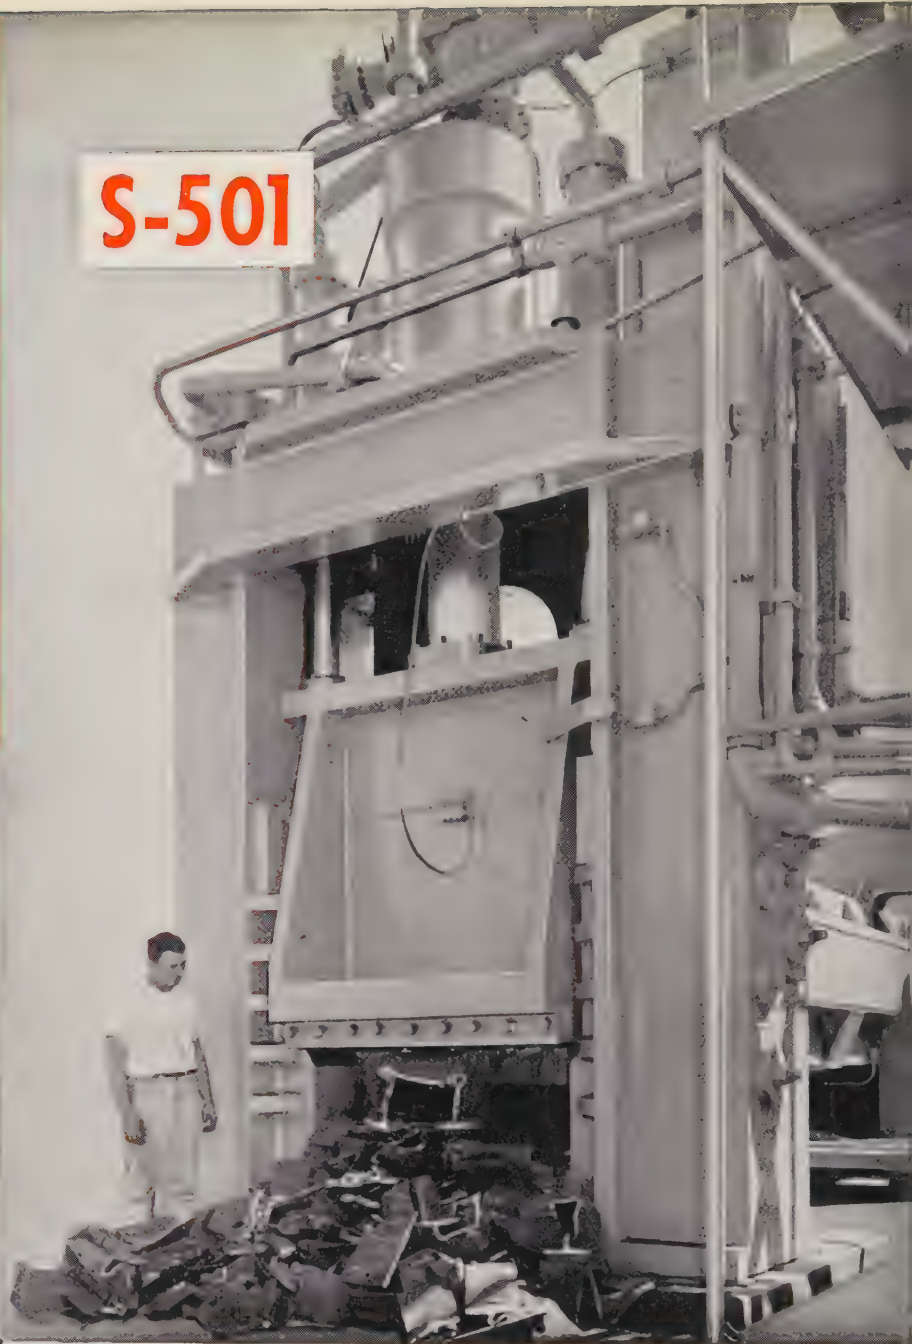

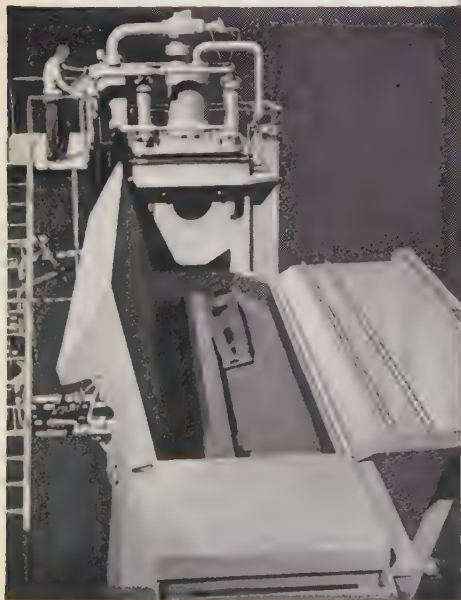

PITTSBURGH, PENNSYLVANIA

CUTS
200 TONS
PLATE
SCRAP
IN EIGHT
HOURS

**production
is continuous**

**labor costs
70% lower**

The Harris Shear is revolutionary in design. It is the first new development in the scrap industry since the introduction of the Baling Press. Railroad scrap, pipe, farm, industrial, automobile and miscellaneous junk shop scrap work through on a 12 second cycle. A 3 man crew and a crane handle the job in all kinds of weather.

**The Harris Shear brings new
profits to Scrap Yards**

The charging box is 264" x 80" x 30". It has a flat type loading hopper. The cover and charging ram operate like a baler. This means more material under each stroke of the knife.

Auto Strife Delays Steel Recovery

LOOK for steel production to resume its upward push as soon as the automotive industry hits full stride. Progress was temporarily halted last week as steelmakers adjusted their output to flagging demand. Automotive orders fell short of expectations, reflecting the disruptive effect of labor disputes. In the last two weeks, automakers have assembled about 170,000 cars. During the like period of 1957, they turned out 231,000.

PRODUCTION LEVELS OFF—Reacting to the slowdown in automotive demand, steelmakers held their operations at 75 per cent of capacity last week. Production was about 2,024,000 tons of steel for ingots and castings. October's output (8,750,000 tons) was the largest of any month since October, 1957. Backlogs of U. S. Steel Corp. increased from 3.2 million tons on June 30 to 3.7 million tons on Sept. 30, says Roger M. Blough, chairman. On Sept. 30, 1957, they totaled 6.4 million tons.

BRIGHT PROSPECTS—As they settle the last of their strikes, the automakers are sure to release additional steel orders. How much they'll buy will depend on how the new cars sell, but first reports are encouraging. Buick Div. of General Motors Corp. received more than 100,000 dealer orders in the month following introduction of its new models (vs. 37,000 in the like period last year). Oldsmobile orders are said to be double those of a year ago, and Chevrolet dealers say they'll take all the cars they can get. American Motors Corp. expects to double its Rambler sales this year.

SHEET SALES BOOMING—Despite the weakness in automotive buying, cold-rolled sheets are in great demand. Most mills are booked solid for November, and some can't promise delivery before mid-December. Appliance manufacturers have increased their orders as their business improves. Warehouses that deal mainly in secondary material (wasters and rejects) are beginning to buy more prime stock, another indication that the price structure is firming.

WIRE PRODUCTS GAIN—An upsurge in wire demand enabled the American Steel & Wire Div. of U. S. Steel Corp. to set a production record last month on the No. 1 rod mill at its Cuyahoga Works, Cleveland. (See Page 45.) This was particularly significant because: 1. It was done in the

face of low-cost foreign competition. 2. It suggests that better days are ahead for the steel industry (wire products are a bellwether).

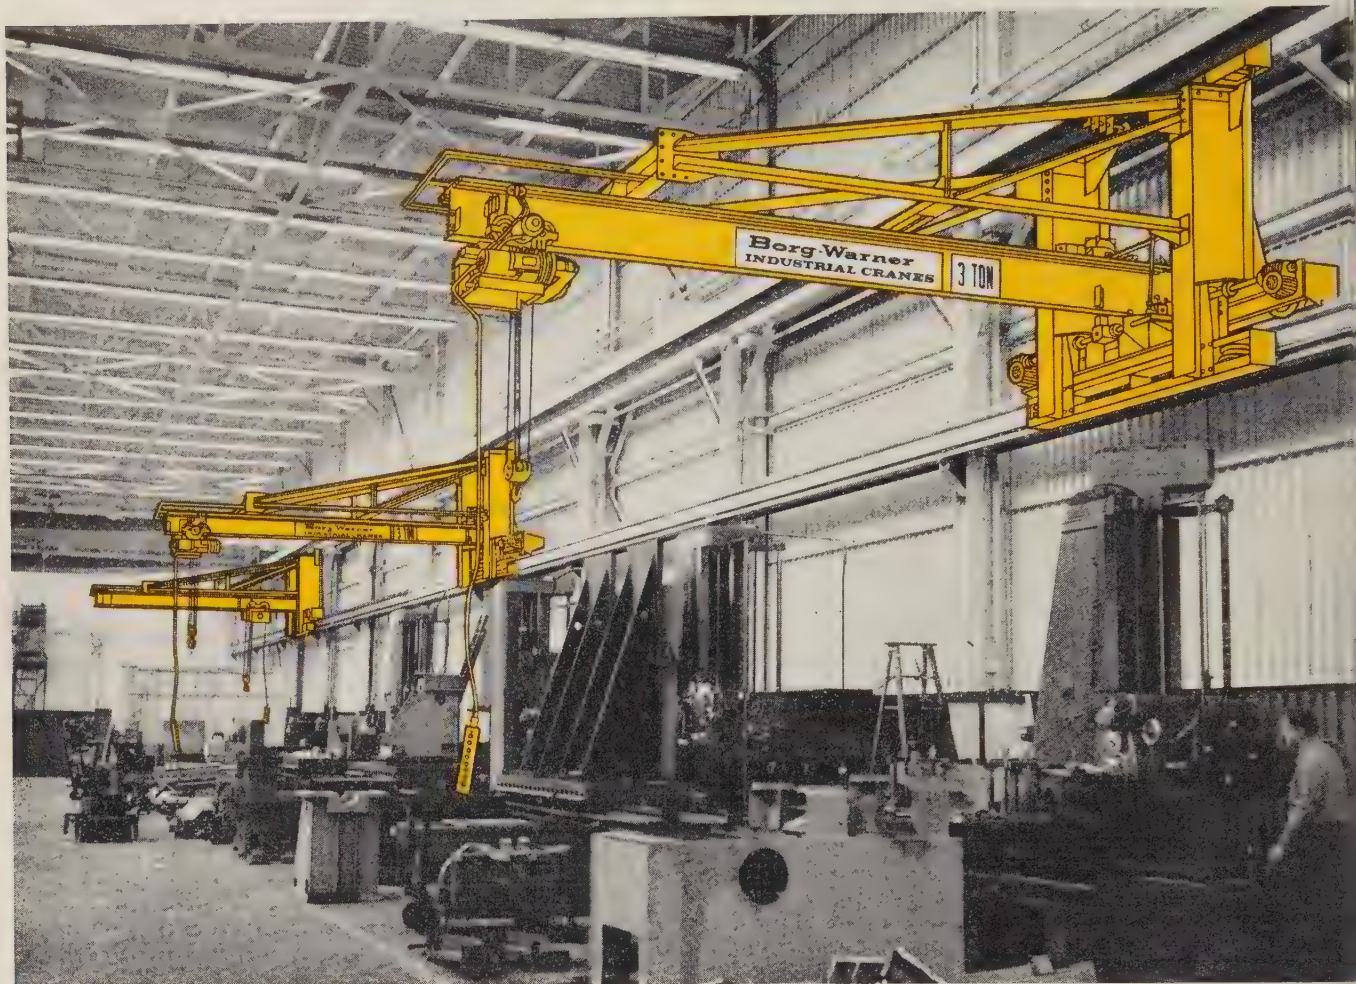

NEW DISCOUNTS ON PIPE—By offering jobbers the same discount (3 per cent) on pipe bought for inventory as they receive on goods shipped directly to their customers, National Tube Div. of U. S. Steel hopes to discourage diversion of direct shipments. The discount will be retroactive to Oct. 13 if jobbers sign contracts with the mill by Nov. 15. Otherwise, it will be effective from the contract date. National Tube is also offering jobbers a commission of \$6 a ton on direct shipments (20 tons or more) of double random length API line pipe, Grades A and B. If the order is less than 20 tons, the jobber handles the billing and gets a 3 per cent discount, but no \$6 commission.

KAISER'S TIN PLATE POLICY—Beset by labor troubles shortly after it began operation of a new tinning line at Fontana, Calif., Kaiser Steel Corp. is giving its customers a break. Although it will raise its prices on Nov. 1, old prices will apply to orders that were on its schedules for October and earlier. (A four-week strike that began on Sept. 13 prevented the company from keeping its commitments.) Customers must accept delivery before Dec. 1 or they'll have to pay the new prices.

Increased production with lower handling costs

Wall Traveling Jibs by

Borg-Warner® INDUSTRIAL CRANES

give maximum use of plant space

Moving smoothly along wall runways Borg-Warner Wall Traveling Jib Cranes are always available for frequent repetitive operations. There is no waiting for crane service — no lost time.

When used in main crane bays, wall traveling jibs give maximum hook coverage and the greatest effective use of otherwise unproductive plant areas. Heavy overhead cranes are left free for other duties.

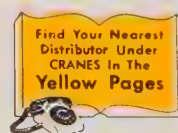

Individual jib cranes may be used at any point along the runway. Or, if greater lifting capacity is needed, two or more jibs can team up on the job. Simple push-button controls allow floor operation.

Borg-Warner Industrial Cranes makes many other types of jib cranes and overhead cranes in capacities up to 150-tons. For practical answers to your materials handling problems call on Borg-Warner Industrial Cranes. Write today.

FIGURES are percentages of respondents to STEEL's quarterly survey. COLOR UNDERSCORED figures show how most respondents reported.

Inventory Buildup Begins in Steel

Users of bars, sheets, and strip will add to stocks in the next three months. Buyers report their needs are growing. Mill deliveries are becoming more extended

FABRICATORS will buy more steel than they use in the remainder of this year, STEEL's quarterly survey of metal inventory trends shows. Some 26 per cent of steel buyers plan to add to their stocks in the next three months. Only 17 per cent think their supplies will be lower three months from now.

• **Trend Turns**—Steel buyers have put the brakes to an inventory-reduction trend which began late in 1956. In each survey since the end of that year, purchasing agents predicted that their stocks would be lower in three months than they were at the time of the survey.

STEEL's Aug. 4 (p. 121) report showed that aluminum, copper, and brass buyers had decided that they had cut stocks enough and should start building supplies again. Now that trend is spreading to steel.

Almost all the inventory building will be in bars, sheets, and strip. Thirty per cent of hot-rolled bar buyers think their stocks will be higher in three months; only 14 per cent think they'll be lower. Cold-finished bar users also look for an inventory buildup. Among buyers of sheets, 31 per cent see an increase in inventories; 13 per cent predict a decrease.

Stocks of plates in three months will be about where they are now. Buyers of heavy plates planning to cut supplies and those who will increase them are about equal in number. STEEL's respondents say there'll be no change in stocks of light plates.

Inventories of structural shapes will decline. Need for structural steel drops in winter. So the majority of firms will reduce supplies.

Among nonferrous buyers, 33 per cent predict a larger inventory in the first quarter of 1959. Some 15 per cent will reduce stocks.

Purchasing agents will build up their stocks because of lengthening mill delivery time, fewer surpluses of metal, and gains in fabricators' operations.

• **Sheets: Hard To Get**—Of all steel products, sheets are tighten-

ing most rapidly, respondents report. Over 10 per cent of all buyers experience difficulty getting enough when they need them. A California fabricator says: "We'll build supply of cold-rolled sheets in the next quarter due to lengthening leadtimes. Producers in this area quote nine to ten weeks' delivery for sheets."

Buyers in key metalworking areas of the Midwest report difficulty in obtaining sheets and other products as quickly as they could three months ago. A Chicago fabri-

cator notes a pinch in hot and cold-rolled sheets. A Detroit buyer says delivery times for galvanized sheets are lengthening.

Although users will have to wait longer for steel to be delivered, they probably won't suffer any disruptions in production schedules. Virtually all respondents say steel arrives when promised, but that promises are being made for later dates.

• **Few Oversupplies** — About one buyer in five reports that he has an overstock of some product, but most

list only one or two items in oversupply. Six months ago (STEEL, May 5, p. 125), two in five buyers had a problem of oversupply, and most of them named five or six products which were in excess.

Dissatisfaction with inventory size has nearly disappeared in plates. Six months ago, 30 per cent of users said they had more than they wanted. Now only 5 per cent have surpluses. About 8 per cent of buyers say they have more hot-rolled bars than they require, and 7 per cent report surpluses of cold-finished bars, sheets, and structurals.

Despite the trend to building inventories, buyers are cautious about pushing stocks above a two-month supply. Average inventories are close to what they were three months ago, with about seven in ten buyers holding ten to 60 days' supply of steel and nonferrous mill products.

As mill delivery schedules lengthen, the proportion of buyers holding stocks of less than ten days is diminishing. Only 8 per cent of aluminum purchasers have that small a supply, compared with 15 per cent of the buyers three months ago.

Tin Plate . . .

Tin Plate Prices, Page 119

Tin plate suppliers have been under pressure from customers to get out shipments before the Nov. 1 price increase. October shipments were up sharply; one Pittsburgh mill's deliveries jumped 35 per cent over its September tonnage to the best level this year.

November shipments will be off noticeably because of the heavy October deliveries and because canning activity is declining seasonally.

Some market observers think that if it hadn't been for the scheduled price boost and the ensuing buying rush, 1958 tin plate shipments would probably have fallen at least 200,000 tons short of last year's total. Export trade, alone, is off that much. Now it's thought the year's total will approach the 5,957,000 tons moved in 1957.

U. S. Steel Export Co., New York, a division of U. S. Steel Corp., recently revised its export prices on tin mill products. The figure on common coke plate (1.25 lb coating), superdraw, was changed to

ABELL-HOWE

BULLETIN

**ABELL-HOWE
COMPANY**

7757 W. Van Buren St., Forest Park, Illinois

\$10.74 per base box. The price was erroneously reported as \$10.75 in the Oct. 13 issue of STEEL.

Steel Bars . . .

Bar Prices, Page 117

Merchant steel bar business is gaining steadily. Inquiry is heavier, and manufacturers, including cold-drawers and fastener producers, are specifying more freely. Larger tonnage is going to distributors, pointing to a step-up in diversified consumption.

The delivery picture hasn't changed much. Mill promises still range two to four weeks on hot-rolled carbon and hot-rolled alloy bars. Cold drawn bars, carbon and alloy, are available for relatively prompt shipment. But it is not as easy as it was to get tonnages inserted in rolling schedules.

Reinforcing Bars . . .

Reinforcing Bar Prices, Page 117

A new building product, Tensiform, is being marketed by Wheeling Steel Corp., Wheeling, W. Va. This steel base can be used as a permanent centering and is designed to support conventional concrete slabs, as well as lightweight aggregate fills. It's fabricated at the Martins Ferry, Ohio, plant from a high tensile steel.

Sheets, Strip . . .

Sheet & Strip Prices, Pages 118 & 119

Auto builders and partmakers are stepping up operations. They're using heavier sheet tonnages. In some cases, they're working overtime to make up for production lost in local strikes. Several plants are engaged at the highest level of the year, but some auto frame tonnage scheduled for November shipment has been deferred until December. Also, a Pittsburgh sheetmaker has been forced to cut its ingot production because its shipments of finished steel to its best customers have been delayed.

Inquiry for flat rolled is more brisk than it has been for some time, even though auto requirements are somewhat disappointing. Demand for hot rolled and cold rolled on automotive accounts should spurt soon.

Makers of household appliances, shipping containers, and office

equipment are specifying tonnage freely. Distributors have also stepped up their orders. Forward buying continues on the cautious side, but an increasing number of consumers are ordering December tonnage in hot and cold rolled.

"Sheet sales are good right across the board," said a Pittsburgh sheetmaker last week. "October shipments were greater than September's, and we look for a continuation of good business this month. Our galvanized book is comfortable."

Deliveries of the various flat rolled items are a little more extended than they were. Hot rolled can be had in three to four weeks, cold rolled in five to seven, and galvanized in eight. Shipments of some flat-rolled specialties, including aluminized and other coated sheets and strip, extend into next year.

While consumers are not inclined toward buying beyond normal requirements, they are watching delivery dates more closely than they were.

The best place to get the steel you want when you want it— is your **LOCAL STEEL SERVICE CENTER**

525 independent steel warehouse companies, which operate 900 separate steel service centers throughout the United States, maintain an \$800 million inventory of more than 3,000,000 tons of steel in all forms, sizes, types, finishes and analyses. No matter where you are located, your local steel service center is best equipped to supply all your metalworking needs, both from the standpoint of economy and quick delivery. Some 15,000 metal specialists selling for these distributors are fully qualified to help you with your problems of selection and fabrication.

STAINLESS STEEL is stocked in 252 of these Steel Service Centers, many of which carry MICROROLD Stainless sheet and strip made by the Washington Steel Corporation.

WASHINGTON STEEL CORPORATION

11-O Woodland Avenue • Washington, Pennsylvania

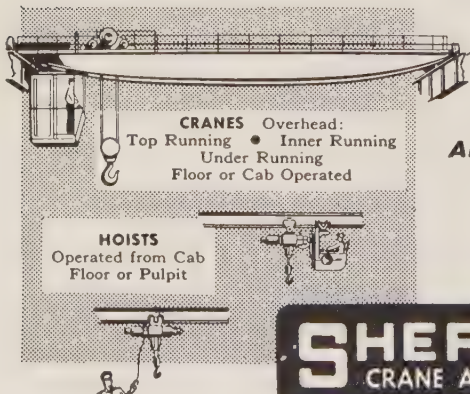

SHEPARD NILES

Large Industrial Cranes 1 to 450 TONS

FOR OVER 50 YEARS, Shepard Niles has been a distinguished name in cranes. A pioneer in the overhead crane industry, Shepard has never failed to modernize and progress through the years. Today its cranes serve thousands of satisfied users, plus an ever-increasing number of new customers.

Shepard offers a complete line of heavy industrial cranes . . . from 1 to 450 tons . . . for light, medium or heavy service. Available for constant or intermittent duty in slow, medium and high speeds; operated from cab or floor. Let a Shepard Niles representative help you select the crane that best fits your plant's load-handling requirements.

• Write for latest Bulletin . . . request a representative to call.

Since 1903**

SHEPARD NILES
CRANE AND HOIST CORPORATION

2384 Schuyler Ave., Montour Falls, N. Y.

Wire . . .

Wire Prices, Pages 119 & 120

Demand for wire rods and manufacturers wire is more active than it was, but deliveries are still available in about two weeks. Merchant wire can be obtained from stocks.

Modern facilities for making heat-treated nails with several times the holding power of ordinary nails are in operation at American Steel & Wire Div.'s (U. S. Steel Corp.) Donora Steel & Wire Works, Donora, Pa. The products, known as Amering and screw-shank nails, are designed for applications where joint strength and holding power are essential. They are available in blued, coated, galvanized, or bright finish.

Plates . . .

Plate Prices, Page 117

If you think you'll need plates in substantial tonnage over coming months, especially next spring, now would seem an excellent time to place your orders with the mills. Reason: Supply is plentiful, and deliveries prompt, a situation that may not prevail when larger semifinished tonnage begins to be channeled into automotive steel products. Right now, plates and shapes are the major products in lightest demand.

While the current market situation does not suggest a spurt in demand from any particular direction, the volume moving is showing improvement. October tonnage bettered that in September, and the general feeling is that November's will register another gain.

Right now there's little buying for inventory even though sheared plates can be had at around two to three weeks and strip-plate and universal plate in three to four weeks. Improved demand for sheets and strip is tightening the situation in strip-plate.

A decision in the Memphis case is expected shortly. If it favors the gas companies, it could revive interest in pipeline construction, and a few orders for pipelines could give the plate market a substantial boost.

Tank business isn't all that it could be, but tankmakers are inquiring for more tonnage, especially for water tanks. Demand on railroad account is spotty, but includes a fair tonnage for a car program at

the Altoona, Pa., shops of the Pennsylvania. Shipwork is holding up, and demand from this area of the market promises to expand. Requirements on machine tool and industrial equipment accounts continue slow.

Japanese plates are reported to have been sold in this country at prices 1.5 cents a pound under the domestic market. Some high tensile plates were included in offerings.

Imported Steel Slipping

Prices on imported steel are off \$2 to \$3 a ton at Houston. Reason: A decision by the French government to cancel shipments to Russia. Also, western Europe is experiencing a recession.

Introduction of Japanese plates to the Texas market is reported. One area distributor has been offered unrestricted tonnages at \$5.35 to \$5.40 per 100 lb. Another report indicates a 2000-ton shipment is on its way from Japan.

Distributors . . .

Prices, Page 124

Business at steel service centers is edging upward, tonnagewise and dollarwise, as a result of recent price increases. Improvement covers practically all the major products and averages between 8 and 10 per cent—compared with September bookings.

Although unusually heavy rains slowed construction in many sections during the early part of last month, outdoor projects generally are accounting for substantial tonnages.

Tubular Goods . . .

Tubular Goods Prices, Page 123

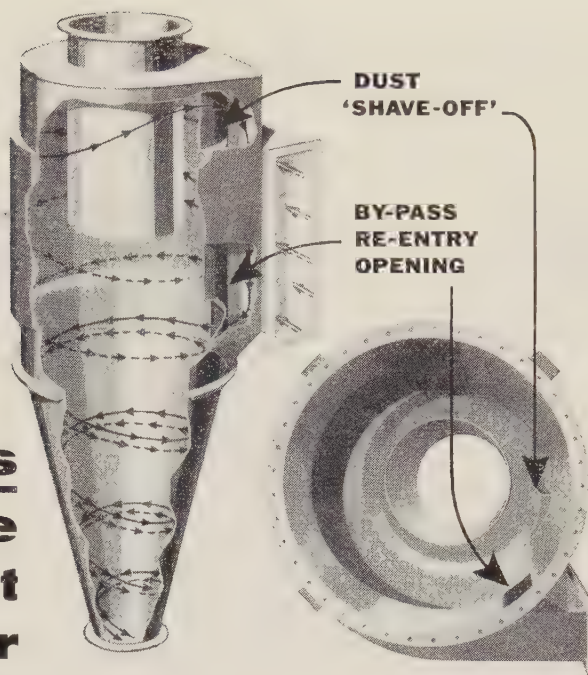

Sharon Steel Corp.'s Brainard Steel Div., Warren, Ohio, dropped production of electricwelded steel tubing and building products and ended its lease with the government on its Griswold plant at Warren.

Automotive inquiry for mechanical tubing is developing, but buyers are slow to place substantial orders. Local auto plant strikes have held up some placements.

Boilermakers are taking a little more pressure tubing.

Although offshore activity is a disturbing factor on the West Coast,

This Cyclone won't clog or plug

Buell's exclusive 'Shave-off' design permits large diameter cyclones that will not clog, plug, or bridge when properly operated: you avoid unnecessary maintenance work or process interruptions.

The unique Shave-off port traps the dust that whirls upward in double-eddy currents, increases cyclone efficiency by eliminating this source of dust reentrainment. Whether installed singly or in groups, Buell Cyclones are the most efficient ever developed.

Other features include extra heavy plate construction for longer service life, Buell-designed manifolds for more efficient, non-turbulent flow of dust-laden gases . . . and the confidence

assured by a history of hundreds of installations everywhere in America. Write for a copy of the 12-page booklet, "The Exclusive Buell Cyclone": Dept. 26-K, Buell Engineering Company, Inc., 123 William St., New York 38.

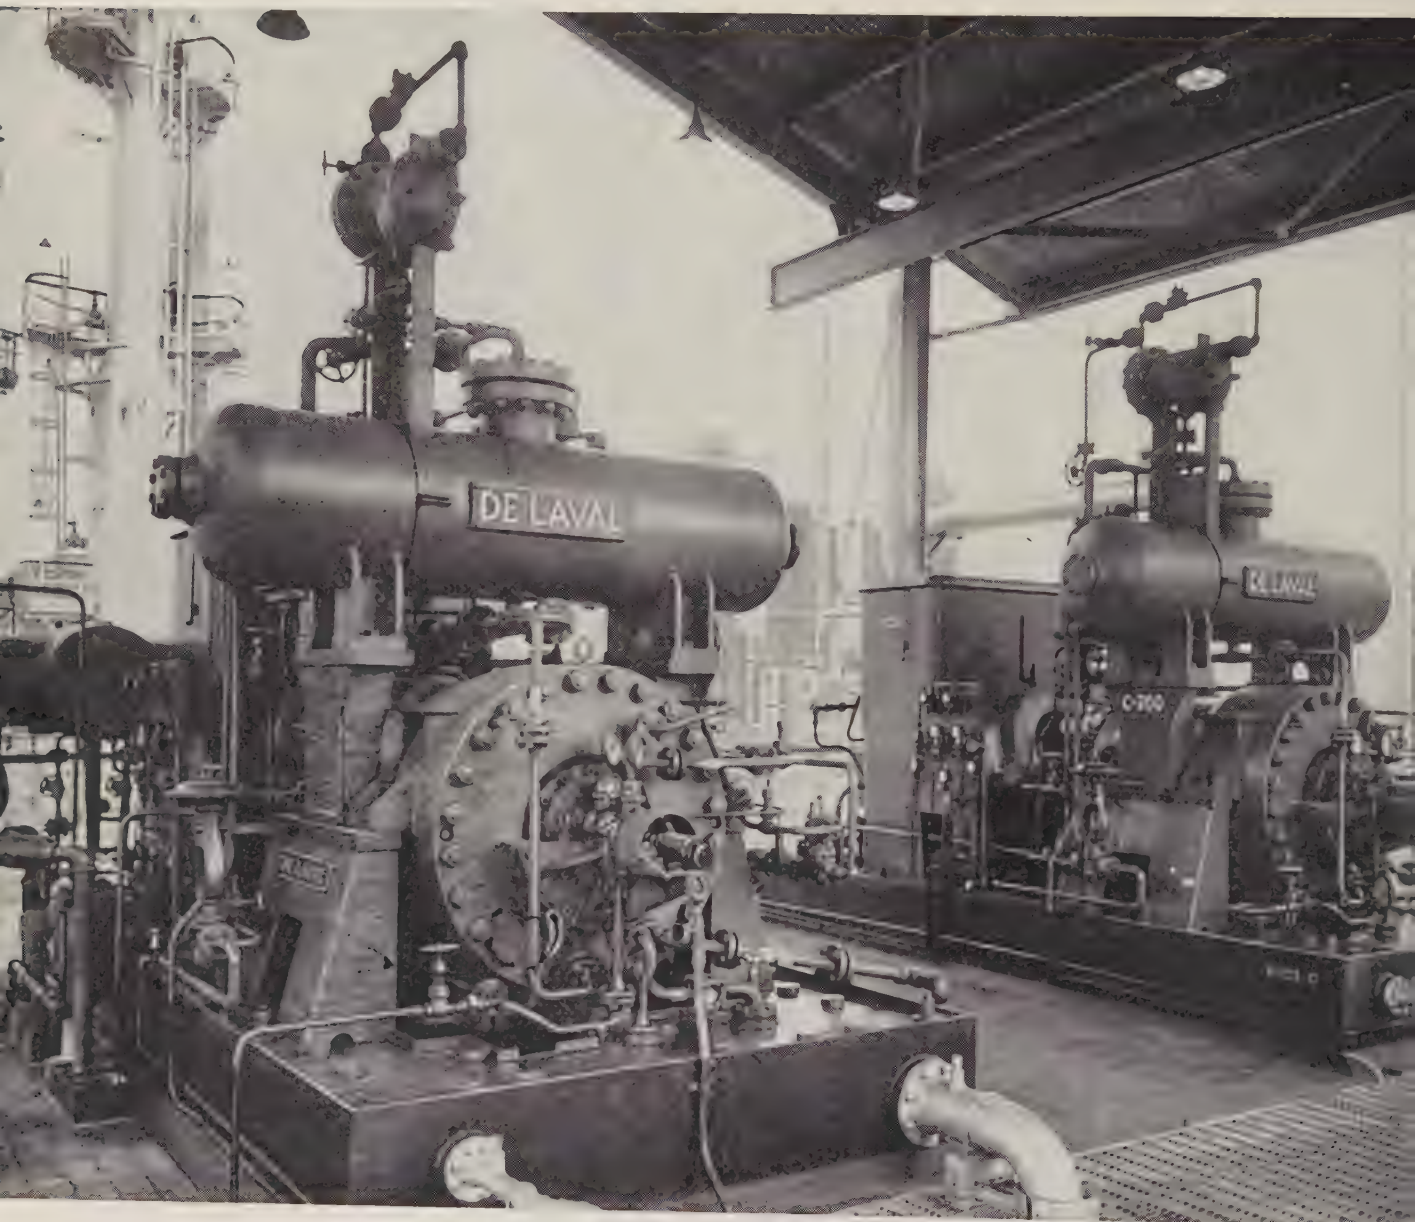

Large-diameter Buell Cyclones in series with Buell 'SF' Electric Precipitator.

Experts at delivering Extra Efficiency in

DUST COLLECTION SYSTEMS

Creative Engineering by **DE LAVAL**

Designing to Customer's Requirements

De Laval makes all sizes and types of centrifugal compressors. But it's that little *extra*, which we call *creative engineering*, that makes De Laval so important to you. Take the two De Laval barrel type centrifugal compressors at Magnolia Petroleum's new refinery, Beaumont, Texas, for example. Designed around given job specifications, they give extra performance, longer

life and trouble-free operation.

Whether it's centrifugal compressors, blast furnace blowers, ship propulsion units, turbine generators or other diversified products serving practically *all* industries, De Laval *creative engineering* plus precision manufacturing and highest quality control assures lasting customer satisfaction.

De Laval Steam Turbine Company
860 Nottingham Way, Trenton 2, New Jersey

area tube sellers report increasing activity, and they expect fourth quarter volume to be fair. Demand for large diameter pipe is better.

Seattle takes bids Jan. 14 for the proposed \$23.5 million Tolt River water supply line, involving 24 miles of 54, 60, and 66 in. steel pipe, 5/16 to 5/8 in. thick.

The city of Portland, Oreg., opens bids Nov. 6 for an unstated tonnage of cast iron pipe.

Ferrous Stocks Decline

Consumption of ferrous materials (scrap and pig iron) in the U. S. in August increased 13 per cent over the July figure, reports the U. S. Bureau of Mines. Pig iron use (4,186,000 gross tons) was higher than it was during any previous month this year. Scrap consumption (4,216,000 tons) was up sharply from that in the preceding month.

The total melt (8,481,000 gross tons) consisted of 49 per cent scrap and 51 per cent pig iron during the month. That ratio was unchanged from the preceding month.

Scrap available for consumption (home plus purchased) in August totaled 4,216,000 gross tons, an increase of 12 per cent over July. Home scrap accounted for 2,427,000 tons and purchases, 1,789,000. Of the purchased material, 86 per cent was received from dealers and 14 per cent from other sources.

Domestic stocks of ferrous materials held by consumers at the end of August totaled 11,303,000 gross tons, a slight decrease from the 11,364,000 on hand July 31. Ferrous scrap stocks amounted to 7,951,000 tons, up slightly from July. Pig iron stocks were 3,352,000 tons, off 3 per cent from the 3,439,000 tons on hand at the end of the preceding month.

Ferroalloys . . .

Vanadium Corp. of America, New York, is introducing two special ferroalloys of the high chromium, extra low carbon type. With minimum 75 per cent chromium content, and maximum carbon of 0.015 or 0.025 per cent, the alloys are said to offer advantages to mills and foundries producing stainless steels and high temperature alloys. The new alloys are known as Exlo (R) "75."

Harvester Revises Prices

International Harvester Co., Chicago, revised prices on a number of products. Heavy duty motor trucks are up 2.5 per cent; prices on medium-sized trucks are unchanged. Wheel-type farm tractors (except the 650 model) are 5.8 per cent higher.

Most farm implements are up 5 per cent, but prices on a number of products weren't changed, including balers, several harrows, tractor trailers, the hillside combine, and the No. 76 combine. The over-all increase on farm equipment, including tractors, is 5.1 per cent.

Construction equipment items are up an average of 3.8 per cent. Crawler tractors are up 5 per cent. Unchanged were prices on power units, rubber tired earth movers, and some off-highway trucks.

Structural Shapes . . .

Structural Shape Prices, Page 117

Except for roadwork, structural steel inquiry is off, partly as the result of seasonal influences. Most fabricating shops are beginning to work tonnages into their schedules for delivery in less than two months.

Competition is becoming increasingly keen. On some bridge approach work, direct bids were submitted by 17 or more fabricators.

Structural deliveries now range two to four weeks.

An outstanding award last week involved 8500 tons for a 31-story office building for the Western Electric Co. in lower New York. It went to the Dreier Structural Steel Co., Long Island City, N. Y. Another important job, involving 6450 tons of steel (including 4900 tons of plates), is the Woodrow Wilson Memorial Bridge approach superstructures at Alexandria, Va. It went to the Pittsburgh-Des Moines Steel Co., Pittsburgh. About two-thirds of the steel will be purchased in the Pittsburgh district.

Washington State highway engineers are expected to call for bids in November or December for the University Bridge, a section of the Seattle freeway, involving about 12,000 tons of structurals. In Montana, bids on the Thompson Falls bridge project have been postponed until later this month. It involves 590 tons.

A master plan for a California

freeway system calls for expenditures of \$10.5 billion in the next 20 years. Included will be 12,250 miles of freeways.

The California highway construction cost index dipped to 231 of the 1940 base in the three months ended June 30. At the end of the first quarter, the index stood at 241.8. The average number of bidders per project dropped to 5.4 from an average of 9.3.

STRUCTURAL SHAPES . . .

STRUCTURAL STEEL PLACED

8500 tons, 31-story office building, Western Electric Co., Broadway and Fulton St., New York, through George A. Fuller Co., general contractor, to the Dreier Structural Steel Co. Inc., Long Island City, N. Y.

1600 tons, generator station, unit No. 6, Indianapolis Power & Light Co., Indianapolis, Ind., to R. C. Mahon Co., Detroit.

400 tons, office structure at Boeing Renton plant, to Bethlehem Pacific Coast Steel Corp., Seattle; the Austin Co., Seattle, general contractor.

330 tons, Washington State highway bridge, Adams County, to Bethlehem Pacific Coast Steel Corp., Seattle; C. E. Oneal, Ellensburg, Wash., general contractor.

300 tons, plant and office building, Edwin J. Shoettle, Upper Gynedd Township, Pennsylvania, to Camden Iron Works, Camden, N. J.

174 tons, Washington State highway span, Skagit County, to Poole, McGonigle & Dick, Portland, Oreg.; Neukirk Bros., Seattle, general contractor.

110 tons, Horn & Hardart Restaurant, King of Prussia, Pa., to Cantley & Co., Philadelphia.

STRUCTURAL STEEL PENDING

12,000 tons, Washington State freeway, University Bridge, Seattle; bids to Olympia, Wash., expected within 60 days.

2200 tons, state bridge, Westchester County, New York.

1300 tons, state bridge in the Rochester-Buffalo area, New York.

1000 tons, senior high school, Pottstown, Pa.; bids Nov. 19.

800 tons, junior high school, Stroudsburg, Pa.; bids closed.

700 tons, United States Commission Building, United Nations, E. 45th Street, New York; bids closed Oct. 31.

600 tons, state bridge, Broome County, New York.

600 tons, observation tower, Niagara Falls, N. Y., for New York State Park Commission; bids closed Oct. 27.

590 tons, Montana State bridge, Thompson Falls, rebids Nov. 6 at Helena, Mont.

435 tons, two bridges, relocation project, bids to Chelan P.U.D. No. 1, Wenatchee, Wash., Nov. 21.

315 tons, state highway bridge, Maine Central Railroad and County Road, Waterville, Maine; bids Nov. 5, Augusta, Maine.

175 tons, state highway bridge, Main St., Waterville, Maine; bids Nov. 5, at Augusta, Maine.

160 tons, Oregon State interchange, Klamath County; general contract to Tom Lillebo, Reedsport, low at \$334,099.

75 tons, liners, trash racks, etc., Tolt water supply line; bids to Seattle Jan. 14.

REINFORCING BARS . . .

REINFORCING BARS PLACED

2100 tons, Ice Harbor Dam, Washington State, to Northwest Steel Rolling Mills Inc., Seattle; Guy F. Atkinson Co., South San Francisco, Calif., general contractor.

165 tons, Washington State highway projects, Adams and Skagit counties, to Bethlehem Pacific Coast Steel Corp., Seattle.

107 tons, student union building, Bellingham, Wash., to Joseph T. Ryerson & Son Inc., Seattle; Hebb & Narodick, Seattle, general contractor.

140 tons, apartment house and church extension, Seattle, to Bethlehem Pacific Coast Steel Corp., Seattle.

REINFORCING BARS PENDING

1600 tons, Tolt River Dam and supply pipe project; bids to Seattle, Jan. 14. 320 tons, also 35 tons of shapes, Washington State, Seattle ramps; bids to Olympia, Wash., Nov. 12.

315 tons, two highway relocation spans; bids to P.U.D. No. 1, Wenatchee, Wash., Nov. 21.

125 tons, Montana State, 410 ft bridge, Sanders County; general award to W. P. Roscoe, Billings, Mont., low at \$94,951.

108 tons, state bridgework, Somerset County, New Jersey; bids Nov. 12.

95 tons, Bureau of Public Roads, bridges, Gallatin County, Montana, and Alaska. Bids: Nov. 4 to Helena, Mont.; Nov. 7, Juneau, Alaska.

PLATES . . .

PLATES PLACED

450 tons, Cedar River supply pipe replacement, to Hydraulic Supply Mfg. Co., Seattle; Frank Coluccio Construction Co., Seattle, low at \$228,294 on the general contract.

300 tons, elevated water tank, to Pittsburgh-Des Moines Steel Co., Seattle, by Portland, Oreg.

PLATES PENDING

18,855 tons, 24 miles of 54, 60, and 66 in. diameter, 5/16 to 5/8 in. thickness, steel water supply line, Tolt River; bids to Seattle, Jan. 14, 1959.

RAILS, CARS . . .

LOCOMOTIVES PENDING

Southern Pacific, seventy 1750 and 1800 hp diesel units, to the Electro-Motive Div., General Motors Corp., La Grange, Ill., and Alco Products Inc., New York.

South African Railways, one-hundred-fifteen 1800-hp diesel electric locomotives to the International General Electric Co. Equipment will be built at Erie, Pa.

RAILROAD CARS PLACED

Southern Pacific, one hundred 85 ft. flatcars for piggyback service, to General American Transportation Corp., Chicago.

Union Tank Car Corp., 42 tankcars to its White, Ill., shop.

Semifinished Steel . . .

Semifinished Prices, Page 117

Introduction of a new line of high strength steels (GLX-W) is announced by Great Lakes Steel Corp., Ecorse, Mich., division of National Steel Corp. The new line consists of a series of fine grained mild carbon steels with characteristics of high strength, toughness, and weldability. These steels are available in yield strengths from 45,000 to 60,000 psi. They possess good notch toughness at normal and subnormal temperatures. Their low carbon and manganese content is said to provide freedom from underbead cracking under adverse welding conditions.

Mill base prices for the four GLX-W series are:

	45W	50W	55W	60W

How SHORT-RUN BENDING PAYS OFF 3 WAYS

FOR LINDE COMPANY, TONAWANDA, NEW YORK

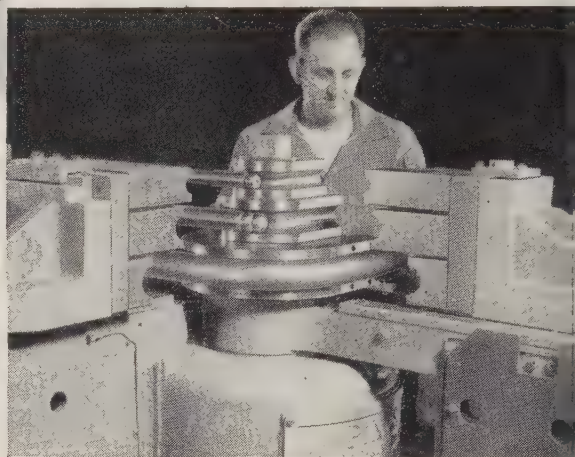

Model 4 Pines Bender at Linde Co. forming bends in 6" aluminum pipe for gas-producing equipment. Single tooling is used for sizes over 2½" O.D. Work averages one to ten pieces per setup.

Diverse Jobs Now Handled on Two PINES Machines

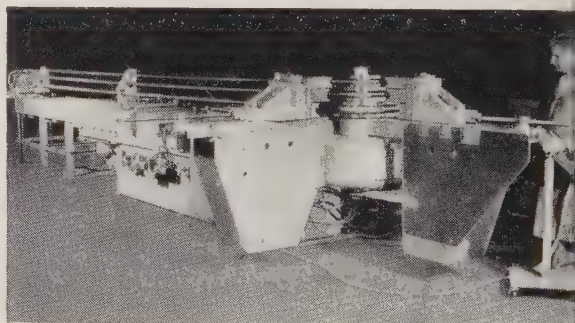

Here's another example of how extremely short runs can be handled efficiently and profitably on Pines Bending Machines. At Linde Company, Division of Union Carbide Corporation, Tonawanda, New York, a large Pines Model 4 and a medium-sized Model 2 Machine are now employed to make bends in a variety of copper alloy, stainless steel, and aluminum tubing. Tube sizes range from ½" up to 6" O.D. Lots average from one to ten pieces per setup. Results show a three-way saving. A large number of costly fittings previously used in fabricating oxygen and inert gas equipment has been eliminated. This, in turn, has effected a substantial reduction in the number of welding operations required. In addition, the facility for making bends quickly and as required has made possible a substantial reduction in inventory investment.

Multiple Dies Minimize Setup Time

As illustrated, for work up to 2½" O.D., a number of multiple stacked dies are employed which substantially reduce setup time. Tools are designed for interchangeability between the Model 2 and Model 4 machines. This permits handling as many as seven different tube sizes without a tool change. The ability to handle different bend angles that a given job may require by simple settings on the machines, contributes also to the efficiency the Linde Company has achieved in handling their requirements.

View of stacked die tooling which permits individual bending of the different tube sizes (1½", 2½", 2½" O.D.) without tool change. Simple machine settings handle different angle requirements.

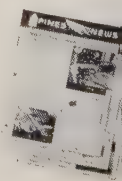

Over-all view of Model 4 machine equipped with three mandrels and stacked dies. Selection of standard radii also minimizes tooling and setup requirements over a wide range of sizes.

UNITED

4-HIGH 6-STAND CONTINUOUS HOT STRIP MILL

UNITED ENGINEERING AND FOUNDRY COMPANY PITTSBURGH, PENNSYLVANIA

Plants at Pittsburgh, Vandergrift, Youngstown, Canton, Wilmington

SUBSIDIARIES: Adamson United Company, Akron, Ohio; Stedman Foundry and Machine Co., Inc., Aurora, Indiana

Designers and Builders of Ferrous and Nonferrous Rolling Mills, Mill Rolls, Auxiliary Mill and Processing Equipment, Presses and other heavy machinery. Manufacturers of Iron, Nodular Iron and Steel Castings and Weldments.

A Review of the Phosphate Coatings

Specified for the Protection of Metal Surfaces

By HUGH GEHMAN, Assistant Manager, Product Development Dept., AMCHEM PRODUCTS, INC.

Phosphate coatings are protective inorganic finishes that actually change the chemical nature of metal surfaces. The metal reacts with the applied phosphate solution to form a nonmetallic, crystalline coating which serves to:

- Improve paint adhesion
- Provide protection against corrosion
- Increase lubricity of friction surfaces
- Facilitate mechanical deformation of metals
- Decorate—in many instances

Satisfactory protection of steel, zinc and aluminum surfaces against corrosion, paint peeling and blistering, and hard wear requires precision methods of chemical conversion coating.

Types of Conversion Coatings

There are seven classes of chemical conversion coatings commonly specified and used throughout industry today. They are as follows:

Zinc-iron phosphate (ACP Granodine®). This is the heaviest type of coating (gray in color) used for prepaint treatments on steel, iron and zinc surfaces. The process requires five or six operations: cleaning; rinsing; rust removal, if necessary; coating; rinsing; and a second rinse. Coating weight ranges from 100 to 600 mg per sq. ft.

Medium or large volume production of automobile bodies, appliances, projectiles and cabinets can be handled effectively.

The coating solution improves paint adhesion by forming a crystalline deposit over the metal surface. This deposit is rough, as revealed microscopically, and so offers an ideal gripping surface for paint particles.

Manganese-iron phosphate (ACP Thermoil-Granodine®). This is a heavy black coating used on friction surfaces to prevent galling, scoring and seizing of parts. Typical metal parts treated are pistons, piston rings, gears, cylinder liners, camshafts, tappets and various small arms components.

Iron phosphate (ACP Duridine®). This is a comparatively new process that places a light coating on surfaces for improved paint adhesion. Since cleaning and coating occur in the same bath, it has only three to five stages.

The iron phosphate treatment is a spray process suited for medium to large volume, large or small work. Pre-cleaning is normally unnecessary, an economy factor in its favor.

Products protected by this process are steel or iron fabricated units, such

as cabinets, washing machines and refrigerators. Weight of coating is 50 to 100 mg per sq. ft.

Zinc phosphate (ACP Lithoform®). This is a crystalline coating produced on galvanized iron and other zinc surfaces—also cadmium—for improving paint adhesion. The purpose of the coating is to provide a paint-gripping surface and to prevent the reaction between acidic components of the paint and the zinc metal, with the formation of soaps and loss of paint adhesion.

This coating is applied in weights of 75 to 500 mg per sq. ft. There are no limitations on volume or production or on size of products treated. Zinc phosphate coating is used on zinc alloy die castings, zinc or cadmium plated sheet or components, hot dip galvanized stock, and Galvanneal.

Amorphous phosphate (ACP Alodine®). This is a relatively new protective coating for aluminum and aluminum alloys. It may be used in place of anodic deposition for improved paint adhesion and corrosion resistance.

This coating is practical for production in any volume. Coating weight is 100 to 600 mg per sq. ft. Products treated include helmets, belt buckles, aircraft and aircraft parts, bazookas and rocket motors, roofing and siding. Particularly good when aluminum is painted prior to forming.

Zinc-iron phosphate for oil absorption (ACP Permagine®). This is a relatively heavy coating adapted to the retention of rust-inhibiting drying or nondrying oils and waxes on ferrous metal surfaces. The coating is applied to a weight of 1000 to 4000 mg per sq. ft.

The process is satisfactory for large or small work in any volume—nuts, bolts, hardware, guns, tools, etc.

Zinc-iron phosphate for metal forming (ACP Granodraw®). This is a specialized coating used in conjunction with a suitable lubricant to facilitate the cold mechanical deformation of steel. The coating acts as an anchor for the lubricant throughout drawing, extrusion, and cold forming operations.

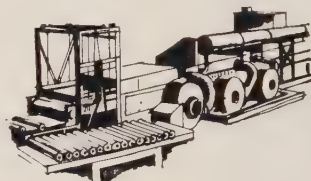

It is a successful treatment for products such as blanks and shells for cold forming, heavy stampings, impact extruded shapes, drawn wire and tube.

For more complete information about any one or all of these chemical conversion coatings, contact an ACP sales representative or write us at Ambler, Pa.

Typical Installations of Phosphate Coating Systems

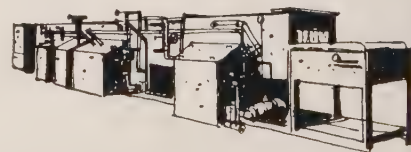

Customer: Truck manufacturer
Problem: Preparing cab parts for painting
Cycle: Phosphate wash; phosphate wash; rinse; chromic acid rinse; dry

Customer: Aluminum screen manufacturer
Problem: Final finish of aluminum shade screen for synthetic enameling
Cycle: Wash; rinse; phosphate coat; rinse; chromic acid rinse; dry

Customer: Water heater manufacturer
Problem: Preparation of water heater shells for synthetic enameling
Cycle: Phosphate wash; rinse; chromic acid rinse; dry

Customer: Hardware manufacturer
Problem: Preparing hardware parts for painting
Cycle: Wash; rinse; phosphate coat; rinse; chromic acid rinse; dry

JAI-ALAI
ACE
FAILS
TO FLAKE
INLAND

TI-CO

FABRICATION WON'T FLAKE TI-CO EITHER

A jai-alai ball travels at speeds over 100 m.p.h.—hits with terrific impact. From a distance of only 60 feet, one of Mexico's leading jai-alai players, Jose Fuerto, slammed the ball into a TI-CO Galvanized Sheet again and again—severely pounding it—but there wasn't a sign of flaking!

In your manufacturing operations, TI-CO can be deep drawn, stamped, bent, crimped, lock-seamed, even spin-drawn, without flaking or peeling. In fact, any product that can be made from cold rolled steel can be made from TI-CO, giving your product dependable protection against corrosion and an eye-appealing finish that can mean stepped-up saleability.

If you are designing or manufacturing a metal product that requires rugged strength plus corrosion resistance, you'll find TI-CO Galvanized Sheets the practical and economical solution. Coils or cut lengths up to 60" widths; gages 8 to 30 inclusive. Consult your local steel distributor or Inland representative. Write today for a free, informative booklet on TI-CO.

RISEING COSTS AND SHRINKING PROFITS EXERT UNUSUAL PRESSURES ON PROCUREMENT

What is the risk of letting conditions tempt you to select the lowest bid?

You're in a tough spot to say the least!

Because if you care at all about *your* future or your company's profits, you take every precaution to make sure that "real deal" price tag is hanging on a machine that *will* do your job.

Obviously, price alone is indicative of nothing more than the bidder's determination of cost, plus the profit any manufacturer must earn to remain in business—nothing more—no true suggestion of value . . . and, of course, never even a hint of equipment suitability to *your* needs.

Unfortunately, the lowest bid often results from price cutting under competitive pressures. And price cutting *necessarily* down grades equipment value—unless the price-cutter is in business for reasons other than making a profit!

Sciaky resistance welding and production equipment *must* satisfy *your* manufacturing requirements. And Sciaky

manufacturing operations must earn a profit just as your company must. That's why Sciaky *first* determines what *will* satisfy your requirements, and then figures the cost of putting it to work for you.

Why take less than the full advantage of consulting with a Sciaky Application Engineer the next time you are considering equipment. No obligation, of course.

Recently a procurement official boasted of his subterfuge to reduce costs . . . "tell every vendor his bid is way out of line, and you can brow-beat them into substantial price reductions." Besides the question of ethics, he's cheating his company of its ability to manufacture profitably, as well. Because no vendor can deliver more than he gets paid for—that is, not if he intends to stay in business. When that official's manufacturing operations begin to sag under the dead weight of phony equipment bargains, who do you suppose is going to be holding the proverbial bag?

SCIAKY BROS., INC., 4909 W. 67th STREET. CHICAGO 38, ILLINOIS • PORTSMOUTH 7-5600

Scrap Price Index Begins To Slip

STEEL's composite on prime grades declines to \$42, off 33 cents due to easiness in the East. Demand for dealer material hurt by increased use of hot metal

Scrap Prices, Page 130

Philadelphia—Major open hearth grades of scrap are off \$1 a ton, with reductions in electric furnace bundles and rail crops. Domestic demand is light and foreign inquiry is nil. Also, an easing factor is plentiful supplies of No. 2 bundles.

Latest revisions bring No. 1 heavy melting, No. 1 bundles and No. 1 busheling to \$40, delivered, No. 2 heavy melting to \$36, and No. 2 bundles to \$24. Electric furnace bundles are now \$42-\$43 delivered, and rail crops, 2 ft and under, \$57-\$59. All grades of borings and turnings are easy but nominally unchanged. Steadiness is noted in low phos structurals and plates, and in couplers, springs, and wheels—also the cast grades.

New York—A decline in European buying and lack of pressure from domestic consumers have

caused brokers to reduce their buying prices on No. 1 heavy melting and No. 1 bundles to \$31-\$32, and on No. 2 heavy melting to \$27-\$28. All other grades are unchanged, including cast and stainless.

Boston — Steel scrap shipments from New England are light with prices little changed. No. 2 bundles are slow, and tonnage is accumulating. A mild improvement in foundry operations has not stimulated cast scrap buying much. Foundries are holding down inventories. The cast grades are firmer, but prices have not increased.

Pittsburgh—Dealers are disposed to hold out for higher prices, but there's little likelihood of an upward movement during the next few weeks. Buyers are being told to keep their stockpiles to a minimum. A specialty mill is getting along on a ten-day inventory.

Some dealers assert they won't

sell No. 1 heavy melting scrap for less than \$45, but others, hard pressed for cash, are delivering small tonnages at \$41. The major mills have given no indication they'll resume buying in November. But if they do, the price of No. 1 scrap might jump to \$48 or \$50. Brokers expect the industrial lists to close \$1 or \$2 lower this month.

Chicago — Lack of consumer interest keeps the scrap market quiet. No price test is expected until demand improves markedly. Some sellers think buyers will not be able to acquire significant tonnages short of \$1 to \$2 above present quotations. A bearish influence is the strong possibility that the steelmaking rate may be at, or close to, the year's peak. In 15 weeks the district rate has climbed from 60.5 per cent of capacity to 85 per cent. Ten blast furnaces here are still idle, and they will be a factor in keeping scrap prices in check.

Cleveland—Bids on month-end automotive scrap lists are expected to set the price trend. Expectations are industrial tonnages will be larger, holding down bids. Dealer scrap is moving sluggishly. Not much change in the situation is expected.

ELECTRIC FURNACE STEEL CASTINGS

CARBON • ALLOY • STAINLESS

"C" Steel Castings possess many qualities other than the strength of steel. They provide for more freedom and efficiency of design, better weight-strength ratio and greater fatigue resistance, i.e., longer life and less replacement. "C" Steel Castings

SAND OR SHELL MOLDED

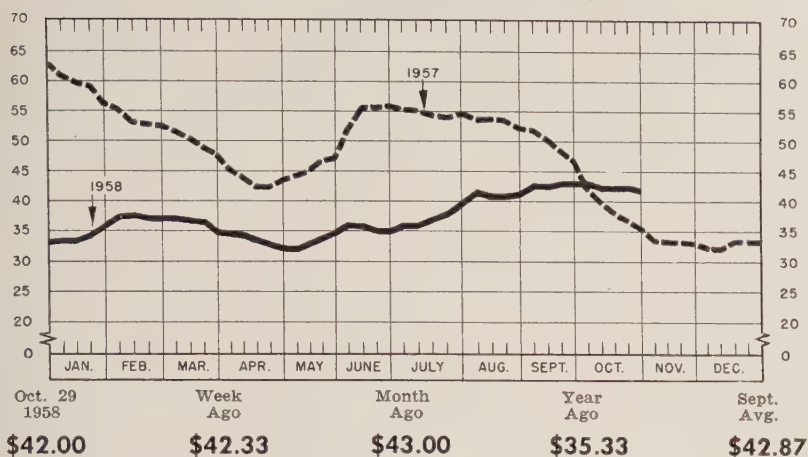

are foundry engineered from pattern to finished casting. They require minimum machining and assembly costs. Perhaps you can utilize the advantages of "C" Steel Castings in your products to reduce costs and gain additional quality and buyers' appeal. Our engineering staff is at your service. Write, phone or call.

CRUCIBLE STEEL CASTING CO.

LANSDOWNE 2, PENNA.

STEELMAKING SCRAP PRICE COMPOSITE

Based on No. 1 heavy melting grade at Pittsburgh, Chicago, and eastern Pennsylvania—Compiled by STEEL.

until steelmaking operations hit 85 per cent of capacity. Idle blast furnace capacity serves to restrain enthusiasm among scrapmen despite the brighter prospects for steelmaking.

Youngstown—Recent sales of auto list scrap were down \$1.25 to \$1.50 a ton, throwing something of a scare into local dealers and brokers. They've been waiting for a clearcut indication of the market trend, and the auto lists may be pointing the way for the market generally. One major buyer here is getting enough scrap from the auto lists to carry operations along without buying from its usual scrap sources.

Detroit—More automotive scrap and the backup of material from canceled export orders make dealers and brokers feel the market will tend downward during November. Several General Motors plants had some October overshipments that have been turned down by brokers and dealers. Chevrolet lists closed early last week, and prices were off \$1.50 to \$1.75 a ton.

Chrysler's November auto lists show an estimated 420 cars of No. 1 grades which is 1000 tons larger than the offering this month. Chrysler sources say they expect this estimate to prove low, and that increased production will boost November scrap generation. Fisher Body plants say the same about their lists.

Buffalo—Dealer scrap is moving slowly. Reason: Mills are using more of their own hot metal, and the flow of production scrap is heavier

than it was. Prices are steady but untested. Larger offerings of prime grades are expected in November industrial lists.

Cincinnati—Prices are unchanged, but traders think the next market movement will be upward. Area steelmakers are expected to pay at least \$1 more for the principal steel-making grades. The district ingot rate is above 80 per cent of capacity and scrapmen think a good demand

for melting material will develop in the weeks ahead.

St. Louis—Open hearth grades of scrap are quoted up \$1 a ton here, but demand is little changed. Not much material is coming into yards, but dealers' holdings are substantial. Still they decline to liquidate their stocks at prices lower than now quoted.

Birmingham—Deliveries are being made on orders for open hearth grades placed early this month. But brokers have cut their quotation \$1 a ton on No. 1 heavy melting. This followed a purchase of No. 2 steel by a district mill at unchanged prices. Cast iron consumers are still filling their requirements at unchanged prices. Demand for electric furnace material is slow. Export trade is inactive.

Houston—Brokers' buying prices are unchanged on the basis of a mill order that will run until Dec. 1. The mill, which bought a fairly heavy tonnage, paid the same prices it did on an earlier order. The new order carries a springboard price for scrap from remote areas.

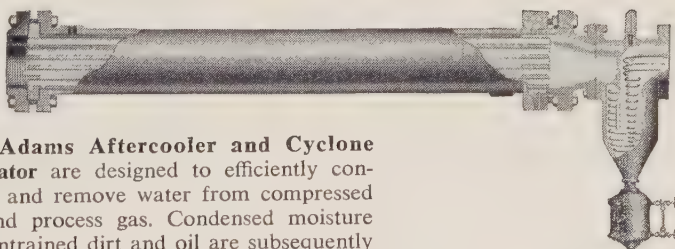

Some exporters continue to lay down material at various Gulf ports,

Aftercooler and Cyclone Separator designed for cleaner, dryer compressed air

R. P. ADAMS CO., INC.

222 East Park Drive, Buffalo 17, New York

The Adams Aftercooler and Cyclone Separator are designed to efficiently condense and remove water from compressed air and process gas. Condensed moisture and entrained dirt and oil are subsequently removed in a cyclone type separator. This unit is scientifically designed for maximum removal efficiency over a wide range of flow rates.

For normal use, units are available to cool gases to within 10° F of the temperature of the cooling water. Specially designed units are available to permit a 2° F approach to cooling water temperature, for application where low moisture content is critical.

Adams Aftercoolers and Separators are available from stock to handle 20 - 40,000 cfm with 10° cooling and 25 - 19,200 cfm

where it is necessary to cool within 2° F of the cooling water. Special units can be supplied to suit an unlimited range of requirements. In all cases the maximum pressure loss at rated capacities is ½ psi.

This wide range of sizes enables the economical utilization of Adams Aftercoolers and Separators in virtually all industrial application. For further information on how R. P. Adams' units will solve your compressed air problems and save you money, write today for Bulletin 711.

Iron and Steel Scrap

Do your Steam Hammers look like this?

TIME TO **MODERNIZE**

**CHAMBERSBURG
STEAM DROP HAMMERS**

have kept pace with modern forge shop requirements. With Chambersburg Steam Drop Hammers you get more forging per blow and more forgings per hour for higher production. And—at the same time you'll find production savings in lower power consumption, less downtime, better die alignment. Every feature of Chambersburg Hammers is designed to produce forgings at the lowest possible cost per piece.

Price Spiral Slows Down

The nonferrous market is getting back on an even keel after several weeks of rapid price revisions. Short term outlook: Some sporadic shifting but no major upheavals

Nonferrous Metal Prices, Pages 134 & 135

THE TIDAL WAVE of price fluctuations that has flooded the non-ferrous market in recent weeks has crested. Don't rule out more revisions but expect a much less volatile market for copper, lead, and zinc in the near future.

• **Copper**—Anaconda Co. and Kennecott Copper Corp. boosted the primary price by 1.5 cents a pound to 29 cents on Oct. 23. Phelps Dodge Corp. followed the next day. Brass mills and wire and cable makers have upped quotations correspondingly.

Relative price stability for the remainder of the year is predicted by some metalmen even though overseas quotations are bounding all over the map. Probably the main pressure for another hike would be continuation of the strikes in Africa and Canada, which have idled 550,000 tons of annual capacity. The walkout at Kennecott's Chino Div. ended Oct. 23, but another strike has shut down Phelps Dodge's refinery at El Paso, Tex. Available supplies are already getting tight. If the walkouts persist, some shortages may occur.

Demand continues to roll along at a good clip. Major producers have upped output to six and seven-day workweeks to satisfy current buying and as a hedge against continuation of the mine strikes.

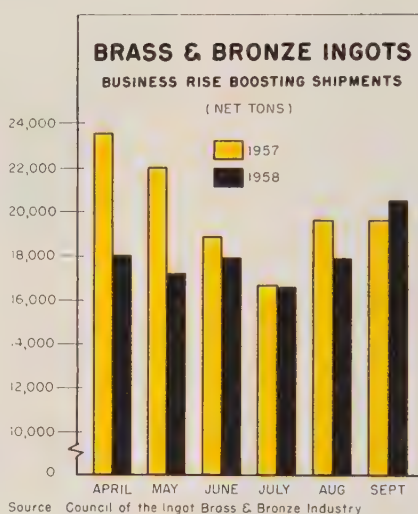

• **Lead**—After six weeks of good volume, demand for lead has tapered off. It's still fair, but there has been a definite lessening in orders from such major customers as battery manufacturers.

Producers explain that some "scare" buying undoubtedly occurred during the recent series of price increases. It's also apparent other customers bought for inventory replenishment as well as current needs and may not have to

come into the market again for several weeks.

Look for lead to hold at 13 cents a pound for the immediate future. The resumption of a workable barter plan seems to be the only factor bullish enough to pace a hike.

The long term price outlook for

lead is slightly up, believes John D. Bradley, president of Bunker Hill Co. His estimate: 14 cents a pound by the end of 1959.

• **Zinc**—Sales are still good but not as strong as they have been. Demand for prime western from galvanizers continues to be zinc's best

market. Special high grade sales to diecasters are fair for some, not so good for others. Says one producer: "Orders for special high grade haven't been anywhere near what we expected. The main reason is that the auto people are still not buying much."

The zinc price is firm at 11 cents a pound and will probably shoot higher before long. Mr. Bradley believes that by the end of next year it will be between 12 and 12.5 cents a pound. Resumption of barter would have the same bullish effect on zinc as it would on lead.

• **More Output**—Recent announcements from some lead and zinc producers indicate plans to step up production of the two metals. Many observers believe the moves are premature, especially in the case of lead where producers' stocks have continued to rise. Their argument: Recently released lead statistics for September show that while domestic refined shipments increased by over 7000 tons to 41,657 tons, producers' refined stocks still went up 1364 tons to 170,666 tons.

Aluminum Catching Up

Shipments of aluminum sheets and plates rose to 100,513,000 lb in September, which brought the nine months total to 873,840,000 lb, reports the Aluminum Association. This compares with shipments of 983,035,000 lb in the first three quarters of last year.

Foil shipments through September hit 140,081,195 lb, compared with 132,129,387 lb in the corresponding period of 1957.

NONFERROUS PRICE RECORD

	Price Oct. 29	Last Change	Previous Price	Sept. Avg	Aug. Avg	Oct., 1957 Avg

How to Make Your Shear a Production Tool

-ADD A

NOBLE

Automatic
**PLATE
HANDLER**

Faster Plate Handling at Lower Cost

The NOBLE Automatic Plate Handler eliminates the 3 slow, costly and often dangerous manual operations sketched at left. The usual 2- or 3-man crew needed to pry up the plate, attach lifting hooks, operate the crane or hoist and move the plate into position is eliminated. At a touch of the control button, your NOBLE Automatic travels to the stack, picks up a plate, raises it to proper height, brings it right to the ball points or casters and puts it into position for shearing, punching, or whatever operation is required. Machine operators and their helpers spend their time on production, not manhandling plate!

LESS IDLE MACHINE TIME...

With a NOBLE Automatic on the job, there's always a plate ready at the machine — no idle standby while operators help wrestle another one off the pile and onto the feed table. You get maximum earning power out of your machine investment.

INCREASED PRODUCTION...

The natural result of reduced idle machine time and faster plate handling. NOBLE Automatic Plate Handler users report a gain of 20% or more, depending on type of application.

THREE TYPES AVAILABLE...

Standard NOBLE automatic plate handling systems are available in floor-mounted rail, overhead rail and radial transfer types. Standard capacities are 1,000, 2,000, 3,000 and 4,000 lbs.

NEW BROCHURE AVAILABLE... describes economies of automatic plate handling, proper applications, typical system layouts, and all NOBLE equipment involved. Write for your free copy today; please address Dept. S-11.

1860 Seventh Street
Oakland 20, California

Nonferrous Metals

Cents per pound, carlots except as otherwise noted.

PRIMARY METALS AND ALLOYS

Aluminum: 99.5%, pigs, 24.70; ingots, 26.80, 20,000 lb or more, f.o.b. shipping point. Freight allowed on 500 lb or more.

Aluminum Alloy: No. 13, 28.60; No. 43, 28.40; No. 195, 29.40; No. 214, 30.20; No. 356, 28.60; 30 or 40 lb ingots.

Antimony: R.M.M. brand, 99.5%, 29.00; Lone Star brand, 29.50, f.o.b. Laredo, Tex., in bulk. Foreign brands, 99.5%, 23.50-24.50, New York, duty paid, 10,000 lb or more.

Beryllium: 97% lump or beads, \$71.50 per lb, f.o.b. Cleveland or Reading, Pa.

Beryllium Aluminum: 5% Be, \$74.75 per lb of contained Be, with balance as Al at market price, f.o.b. shipping point.

Beryllium Copper: 3.75-4.25% Be, \$43 per lb of contained Be, with balance as Cu at market price on shipment date, f.o.b. shipping point.

Bismuth: \$2.25 per lb, ton lots.

Cadmium: Sticks and bars, \$1.45 per lb deld.

Cobalt: 97.99%, \$2.00 per lb for 550-lb keg; \$2.02 per lb for 100 lb case; \$2.07 per lb under 100 lb.

Columbium: Powder, \$55-85 per lb, nom.

Copper: Electrolytic, 29.00 deld.; custom smelters, 30.00; lake, 29.00 deld.; fire refined, 28.75 deld.

Germanium: First reduction, \$179.17-197.31 per lb; intrinsic grade, \$197.31-220 per lb, depending on quantity.

Gold: U. S. Treasury, \$35 per oz.

Indium: 99.9%, \$2.25 per troy oz.

Iridium: \$70-80 nom. per troy oz.

Lead: Common, 12.80; chemical, 12.90; cor-rod, 12.90, St. Louis. New York basis, add \$0.20.

Lithium: 98 + %, 50-100 lb, cups or ingots, \$12; rod, \$15; shot or wire, \$16. 100-500 lb, cups or ingots, \$10.50; rod, \$14; shot or wire, \$15, f.o.b. Minneapolis.

Magnesium: Pig, 35.25; ingot, 36.00 f.o.b. Velasco, Tex.; 12 in. sticks, 59.00 f.o.b. Madison, Ill.

Magnesium Alloys: AZ91A (diecasting), 40.75 deld.; AZ63A, AZ92A, AZ91C (sand casting), 40.75, f.o.b. Velasco, Tex.

Mercury: Open market, spot, New York, \$233-236 per 76-lb flask.

Molybdenum: Unalloyed turned extrusions, 3.75-5.75 in. round, \$9.60 per lb in lots of 2500 lb or more, f.o.b. Detroit.

Nickel: Electrolytic cathodes, sheets (4 x 4 in. and larger), unpacked, 74.00; 10-lb pigs, unpacked, 78.25; "XX" nickel shot, 79.50; "F" nickel shot for addition to cast iron, 74.50; "B" nickel, 5 lb ingots in kegs for addition to cast iron, 75.50. Prices f.o.b. Port Colborne, Ont., including import duty. New York basis, add 1.01. Nickel oxide sinter at Buffalo, New York, or other established U. S. points of entry, contained nickel, 69.60.

Osmium: \$70-100 per troy oz nom.

Palladium: \$15-17 per troy oz.

Platinum: \$57-60 per troy oz from refineries.

Radium: \$16-21.50 per mg radium content, depending on quantity.

Rhodium: \$118-125 per troy oz.

Ruthenium: \$45-55 per troy oz.

Selenium: \$7.00 per lb, commercial grade.

Silver: Open market, 90.375 per troy oz.

Sodium: 17.00 c.l.; 19.00-19.50 l.c.l.

Tantalum: Rod, \$60 per lb; sheet, \$55 per lb.

Tellurium: \$1.65-1.85 per lb.

Thallium: \$7.50 per lb.

Tin: Straits, N. Y., spot, 97.50; prompt, 97.375.

Titanium: Sponge, 99.3 + % grade A-1, ductile (0.3% Fe max.), \$1.62-1.82; grade A-2 (0.5% Fe max.), \$1.70 per lb.

Tungsten: Powder, 89.8%, carbon reduced, 1000-lb lots, \$3.15 per lb nom., f.o.b. shipping point; less than 1000 lb, add 15.00; 99 + % hydrogen reduced, \$3.30-3.80.

Zinc: Prime Western, 11.00; brass special, 11.25; intermediate, 11.50, East St. Louis, freight allowed over 0.50 per lb. New York basis, add 0.50. High grade, 12.00; special high grade, 12.25 deld. Diecasting alloy ingot No. 3, 13.50; No. 2, 13.75; No. 5, 13.50 deld.

Zirconium: Reactor grade sponge, 100 lb or less, \$7 per lb; 100-500 lb, \$6.50 per lb; over 500 lb, \$6 per lb.

(Note: Chromium, manganese, and silicon metals are listed in ferroalloy section.)

SECONDARY METALS AND ALLOYS

Aluminum Ingot: Piston alloys, 23.50-25.25; No. 12 foundry alloy (No. 2 grade), 21.50-22.00; 5% silicon alloy, 0.60 Cu max., 24.75-25.00; 13 alloy 0.60 Cu max., 24.75-25.00; 195 alloy, 25.25-26.00; 108 alloy, 22.25-22.50. Steel deoxidizing grades, notch bars, granulated or shot; Grade 1, 22.75; grade 2, 21.50; grade 3, 20.50; grade 4, 18.00.

Brass Ingot: Red brass, No. 115, 29.00; tin bronze, No. 225, 38.00; No. 245, 32.75; high-leaded tin bronze, No. 305, 33.25; No. 1 yellow, No. 405, 24.00; manganese bronze, No. 421, 25.75.

Magnesium Alloy Ingot: AZ63A, 37.50; AZ91B, 37.50; AZ91C, 41.25; AZ92A, 37.50.

NONFERROUS PRODUCTS

BERYLLIUM COPPER

(Base prices per lb, plus mill extras, 2000 to 5000 lb; nom. 1.9% Be alloy.) Strip, \$1.885, f.o.b. Temple, Pa., or Reading, Pa.; rod, bar, wire, \$1.865, f.o.b. Temple, Pa.

COPPER WIRE

Bare, soft, f.o.b. eastern mills, 20,000-lb lots, 34.35; l.c.l., 34.98. Weatherproof, 20,000-lb lots, 35.54; l.c.l., 36.29.

LEAD

(Prices to jobbers, f.o.b. Buffalo, Cleveland, Pittsburgh.) Sheets, full rolls, 140 sq ft or more, \$18.50 per cwt; pipe, full coils, \$18.50 per cwt; traps and bends, list prices plus 30%.

TITANIUM

(Prices per lb, 10,000 lb and over, f.o.b. mill.) Sheets and strip, \$8.50-15.95; sheared mill plate, \$6.00-9.50; wire, \$6.50-11.00; forging billets, \$3.80-4.10; hot-rolled and forged bars, \$5.10-5.25.

ZINC

(Prices per lb, c.l., f.o.b. mill.) Sheets, 24.00; ribbon zinc in coils, 20.50; plates, 19.00.

ZIRCONIUM

Plate, \$12.50-19.20; H.R. strip, \$12.50-22.90; C.R. strip, \$15.90-31.25; forged or H.R. bars, \$11.00-17.40.

PLATING MATERIALS

(F.O.B. shipping point, freight allowed on quantities)

ANODES

Cadmium: Special or patented shapes, \$1.45.
Copper: Flat-rolled, 45.79; oval, 44.00; 5000-10,000 lb; electrodeposited, 38.50, 2000-5000 lb lots; cast, 41.00, 5000-10,000 lb quantities.

Nickel: Depolarized, less than 100 lb, 114.25; 100-499 lb, 112.00; 500-4999 lb, 107.50; 5000-29,999 lb, 105.25, 30,000 lb, 103.00. Carbonized, deduct 3 cents a lb.

Tin: Bar or slab, less than 200 lb, 115.50; 200-499 lb, 114.00; 500-999 lb, 113.50; 1000 lb or more, 113.00.

Zinc: Balls, 17.50; flat tops, 17.50; flats, 20.25; ovals, 19.50, ton lots.

CHEMICALS

Cadmium Oxide: \$1.45 per lb in 100-lb drums.
Chromic Acid (flake): 100-2000 lb, 31.00; 2000-10,000 lb, 30.50; 10,000-20,000 lb, 30.00; 20,000 lb or more, 29.50.

Copper Cyanide: 100-200 lb, 65.90; 300-900 lb, 63.90; 1000-19,900 lb, 61.90.

Copper Sulphate: 100-1900 lb, 14.65; 2000-5900 lb, 12.65; 6000-11,900 lb, 12.40; 12,000-22,900 lb, 12.15; 23,000 lb or more, 11.65.

Nickel Chloride: 100 lb, 45.00; 200 lb, 43.00; 300 lb, 42.00; 400-4900 lb, 40.00; 5000-9900 lb, 38.00; 10,000 lb or more, 37.00.

Nickel Sulphate: 5000-22,000 lb, 29.00; 23,000-35,900 lb, 28.50; 36,000 lb or more, 28.00.

Sodium Cyanide (Cyanobrik): 200 lb, 20.80; 400-800 lb, 19.80; 1000-19,800 lb, 18.80; 20,000 lb or more, 17.80.

Sodium Stannate: Less than 100 lb, 76.90; 100-600 lb, 67.80; 700-1900 lb, 65.00; 2000-9900 lb, 63.10; 10,000 lb or more, 61.80.

Stannous Chloride (anhydrous): 25 lb, 152.00; 100 lb, 147.10; 400 lb, 144.60; 800-19,900 lb, 103.80; 20,000 lb or more, 97.70.

Stannous Sulphate: Less than 50 lb, 137.30; 50 lb, 107.30; 100-1900 lb, 105.30; 2000 lb or more, 103.30.

Zinc Cyanide: 100-200 lb, 59.00; 300-900 lb, 57.00.

(Concluded from Page 129)

but, as yet, no vessel loadings are scheduled for November.

Seattle—Sales continue limited, and yard receipts are small. District mills hold heavy inventories, and the larger buyers are out of the market. Offshore shipments consist of a few scattered small lots moving to Japan. Quoted prices are nominal.

Los Angeles—Two large mills indicate they will soon resume buying, and some optimistic traders are increasing their collections for the first time in months.

San Francisco—Steel mills are operating at a higher rate here, but they are not expected to enter the scrap market on an active scale the rest of this year. Reason: Mill inventories are substantial.

Sees Poor Year for Scrap

This will be one of the poorest years for the scrap industry since the thirties, Myron L. Chase, president, Institute of Scrap Iron & Steel Inc., recently told the Central Pennsylvania Chapter at Reading, Pa.

He predicts: Consumption of all types of purchased scrap, including industrial material, isn't expected to exceed 22 million tons in 1958.

Titanium Prices Reduced

Substantial price reductions on titanium sponge, billet, and bar products were announced last week by Mallory-Sharon Metals Corp., Niles, Ohio.

Sponge, in quantities over 500 lb, to a maximum of 100 Brinell hardness, was cut to \$1.62 a pound. Billet stock was lowered to \$3.80 a pound (from \$4.10); finishing extras for over-all ground material were reduced to 30 cents a pound (from 40 cents); and lathe turnings were reduced to 60 cents a pound (from 80 cents).

Bar prices were cut to \$5.10 a pound (from \$5.25); these size extra changes were made: Rounds over 2 in. to 4½ in., reduced to 15 cents a pound (from 35 cents); flats and squares over 2 in. to 4 in. to 15 cents a pound (from 35 cents); flats and squares over 1 in. to 2 in. to 50 cents (from 85 cents); over ½ in. to 1 in. to \$1 (from \$1.60); over 5/16 in. to ½ in. to \$1.50 (from

\$2.10); and less than 5/16 in. to \$2 (from \$2.60).

All finishing extras were reduced 15 cents a pound.

Pig Iron . . .

Pig Iron Prices, Page 124

Buying interest in the pig iron market is improving. The recovery still lags behind that in steelmaking.

A modest upturn in orders and operations is reported by foundries serving the railroads which are buying equipment a little more actively. Most automotive foundries have resumed operations following strike shutdowns and are expected to place larger orders. Generally, captive foundries are operating at a higher rate than jobbing shops.

Most steel mills are using the bulk of their pig iron output in

their own open hearth melts. This is a break for the merchant iron producers since it reduces the competition for foundry business. Steel mills tend to use more hot metal in their melts.

Metallurgical Coke . . .

Metallurgical Coke Prices, Page 123

Coke production in August totaled 4,314,766 net tons, reports the U. S. Bureau of Mines. That's an increase of 9 per cent over July's total of 3,957,230, and is off sharply from the 6,539,600 produced in August, 1957.

The August breakdown: Oven coke, 4,275,546 tons, vs. 3,927,718 in July and 6,382,600 in August last year. Beehive coke, 39,220 tons, vs. 29,512 the preceding month, and 157,000 in the like month of 1957.

Production in the first eight months this year amounted to 33,125,077 net tons (32,814,632 oven coke, 310,445 beehive). In the like period last year, output totaled 52,542,200 tons (50,889,100 oven, 1,653,100 beehive).

Stocks of oven coke held by producers at the end of August amounted to 4,006,918 tons, equal to 29.1 days' production. On the same date a year ago, the total was 2,544,906 tons, equal to 12.2 days' production.

Production of oven-coke breeze in August was 289,466 tons, vs. 261,256 in July and 415,300 in August, 1957. Output in the first eight months totaled 2,176,593 tons, vs. 3,351,800 in the like 1957 period.

Canada . . .

Structural steel prices have been upped \$4 a ton to \$110 by the Algoma Steel Corp. Ltd., Sault Ste. Marie, Ont. Prices on rails, skelp, and some grades of sheets have also been raised. Other Canadian producers have not yet followed.

Algoma has reached agreements with the union on new wage schedules, but no settlement between the union and the Steel Co. of Canada has been reached. Negotiations are being speeded up. Hopes for an early agreement are high.

Production of steel ingots in Canada during the week ended Oct. 16 was 56,784 net tons, equal to 49.9 per cent of rated capacity. Output the week preceding was 54,256 tons, or 47.7 per cent.

▲ Jeffrey magnetic separators help raise iron content of pellets to 64%.

Jeffrey vibrating feeders keep ore on the move. ▶

New Taconite Plant sets 24-hour, year-round pace!

IRON YIELD of the Mesabi Range is being greatly extended by a new plant which can, *every day*, turn about 63,000 long tons of taconite ore into approximately 20,000 tons of pellets bearing up to 64% iron. Efficient, trouble-free Jeffrey equipment is an important part of the vast and highly mechanized operation which makes this processing economically practical.

Jeffrey Magnetic Separators — 216 ball mill roughers and finishing separators are used in concentrator operations. After proper settings are made, feed may vary from zero to maximum capacity without further adjustment. Separators furnished in both permanent and electro types.

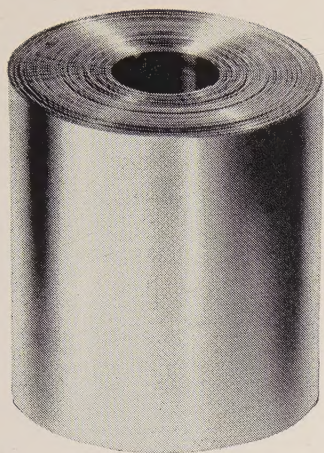

Jeffrey Vibrating Feeders — 48 heavy duty 5DTS units feed coarse ore from surge bins to cone crushers and screens. 324 Type 4DTH units feed fine ore to rod mills. 48 Type 4DTS feeders handle hot pellets. Balanced vibration assures quiet operation, definite control, easier installation, low operating and maintenance costs.

In all types of mining and processing of solids, carefully engineered, precision built Jeffrey machinery and components provide long, dependable service. Write for Catalog 910. The Jeffrey Manufacturing Company, 889 North Fourth Street, Columbus 16, Ohio.

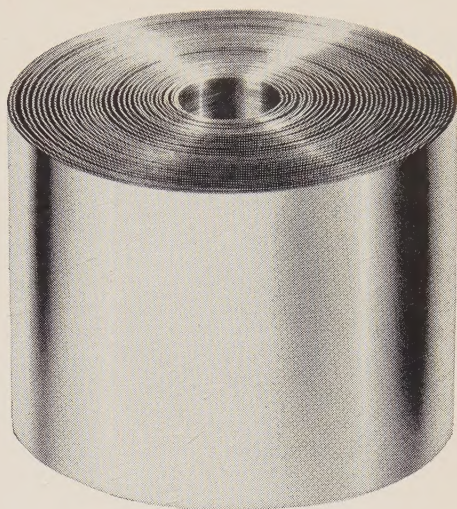

JEFFREY

CONVEYING • PROCESSING • MINING EQUIPMENT...TRANSMISSION MACHINERY...CONTRACT MANUFACTURING

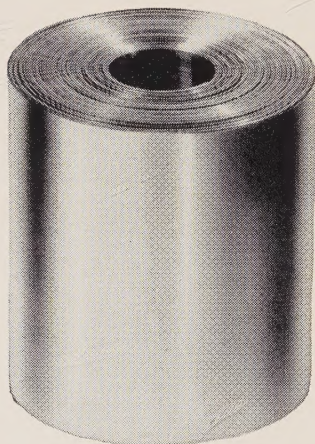

To anneal it better... faster...

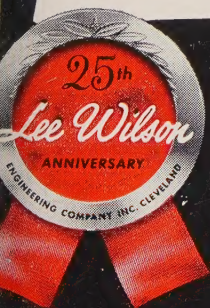

..... open it up....

... heat every wrap with
exacting precision ...

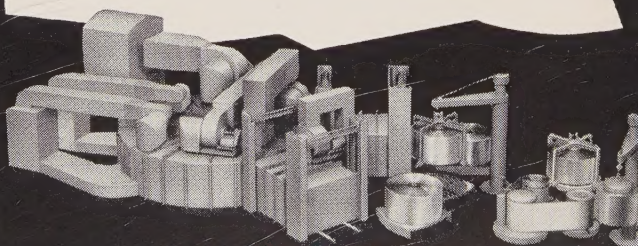

... recoil for processing

Lee Wilson's revolutionary new coil opening system exposes as much as 400 times more coil area to furnace heat. This obviously means faster heating with substantially better control... a better annealed product, and production rates that reduce

process inventory at annealing stations by 80 percent. Be sure you have all the facts on the amazing new Opened Coil Annealer before you purchase additional annealing furnace equipment.

How 1,008 Mills Cut Bearing Cost Per Ton Of Steel Rolled

By mounting roll necks on Timken® tapered roller bearings, a rapidly increasing number of steel mills keep production high, downtime low, and hold bearing cost per ton of steel rolled at rock bottom. Here's why:

- 1. LONGER BEARING LIFE.** Tonnage records from hundreds of mills demonstrate that the long life of Timken bearings on mill roll necks holds bearing cost per ton of steel rolled, to a minimum.
- 2. BETTER MILL RIGIDITY.** Timken roll neck bearings have a unique balanced proportion design that lets you use larger roll necks than ever before possible with tapered roller bearings.
- 3. SIMPLIFIED LUBRICATION.** You don't need complicated lubricating systems when you use Timken roll neck bearings. They permit use of simpler, less expensive grease lubrication.
- 4. HIGHER LOAD RATINGS.** Balanced proportion design provides up to 40% greater bearing capacity than previous designs for a given mill roll size.
- 5. SPECIAL THRUST BEARINGS ELIMINATED.** Because Timken bearings are designed to take *both* radial and thrust loads, they save you the extra cost of special thrust bearings.
- 6. STEEL LOSS ENDED IN MILL STOPS AND STARTS.** With mill roll necks mounted on Timken tapered roller bearings, you can start your mills under full load—and end unnecessary loss of steel.
- 7. FASTER MILL ROLLING SPEEDS.** Because Timken bearings are designed with true rolling motion and practically eliminate friction, your mills can roll at higher speeds than otherwise possible.

You can get all these advantages in existing or new equipment when you specify Timken tapered roller bearings for your back-up and work rolls. Get complete details from our specialists. Just call or write The Timken Roller Bearing Company, Canton 6, Ohio. Canadian plant: St. Thomas, Ontario. Cable: "TIMROSCO".
